WGU Cloud Deployment and Operations Sample Questions (Q62-Q67):

NEW QUESTION # 62

(Which function is used to obtain components defined in an AWS CloudFormation template?)

- A. Cidr
- B. GetAZs
- C. Ref
- D. ImportValue

Answer: C

Explanation:

The 'Ref' function in an AWS CloudFormation template is used to obtain values of components defined within the template, such as resource IDs, parameters, or outputs. This function allows dynamic referencing of resources during stack creation. The WGU Cloud Deployment and Operations Study Guide (Section 5.3, CloudFormation Functions) states, "The 'Ref' function is used to reference

the logical IDs of resources, parameters, or mappings defined in the template, enabling dynamic value retrieval (e.g., `Ref: MyEC2Instance` returns the instance ID). `ImportValue` is used for cross-stack references, `Cidr` for IP range calculations, and `GetAZs` for availability zone lists, making them unsuitable here.

NEW QUESTION # 63

(Which component should be used to configure email notifications for a trigger by Amazon Made?)

- A. EventBridge
- B. Elastic Kubernetes Service
- C. CodeDeploy
- D. Simple Queue Service

Answer: A

Explanation:

Amazon EventBridge should be used to configure email notifications for a trigger by Amazon Made, as it can route events to targets like Amazon SNS (Simple Notification Service) for email delivery. EventBridge integrates with AWS services to handle event-driven notifications. The WGU Cloud Deployment and Operations Study Guide (Section 4.3, EventBridge) states, "EventBridge can be configured to send events from Amazon Made to SNS, enabling email notifications by subscribing an email endpoint to the SNS topic." SQS, EKS, and CodeDeploy do not support this notification configuration.

NEW QUESTION # 64

(A company is using Route 53 for Domain Name System (DNS) hosting. The company requires a zone that should only be accessible from instances in a Virtual Private Cloud (VPC). Which type of hosted zone should be used?)

- A. Public Hosted Zone
- B. DNS Zone
- C. Lightsail DNS Zone
- D. Private Zone

Answer: D

Explanation:

A Private Hosted Zone in Amazon Route 53 should be used to restrict DNS resolution to instances within a Virtual Private Cloud (VPC), ensuring that the zone is only accessible internally. This isolates DNS services from public internet access. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Hosted Zones) states, "A Private Hosted Zone in Route 53 limits DNS resolution to resources within a specified VPC, preventing external access and enhancing security for internal services." Public Hosted Zones, DNS Zones, and Lightsail DNS Zones do not provide this VPC-specific restriction.

NEW QUESTION # 65

(An administrator needs to implement Amazon Route 53 multivalue routing policy. The operator must ensure that Route 53 will respond to incoming requests with the maximum allowed number of records. How many records should be created?)

- A. 0
- B. 1
- C. 2
- D. 3

Answer: C

Explanation:

The multivalue routing policy in Amazon Route 53 allows up to 8 healthy records to be returned in response to DNS queries, enabling load balancing across multiple resources. To ensure the maximum allowed number of records is utilized, the administrator should create 8 records. The WGU Cloud Deployment and Operations Study Guide (Section 3.1, Route 53 Routing Policies) specifies, "Multivalue answer routing supports up to 8 healthy resource record sets per response, requiring the creation of 8 records to maximize the policy's capability." Options A, C, and D exceed or fall short of this limit.

NEW QUESTION # 66

(A company is using the CloudWatch agent on its EC2 Linux instances. The company needs to determine how long read requests have waited on the instance's I/O for proper sizing of the instance. Which metric should the company use?)

- A. diskio_reads
- B. disk_read_ops
- C. disk_io_time
- D. diskio_read_bytes

Answer: C

Explanation:

The `'disk_io_time'` metric, collected by the CloudWatch agent on EC2 Linux instances, measures the total time (in milliseconds) that read and write requests have waited on I/O, helping to assess disk performance for instance sizing. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Agent Metrics) states, "The `'disk_io_time'` metric, available via the CloudWatch agent, tracks the time spent waiting for I/O operations, providing insight into disk contention for optimizing EC2 instance sizing." `disk_read_ops`, `diskio_reads`, and `diskio_read_bytes` measure operation counts or bytes, not wait times.
