Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q67-Q72):

NEW QUESTION # 67
Why is a Cisco Nexus switch typically deployed in a network?

- A. In branch offices for local area networking
- B. As edge routers connecting to ISPs
- C. In data centers for high-performance, low latency switching
- D. As wireless access points in enterprise campuses

Answer: C

Explanation:
Cisco Nexus switches are specifically designed for deployment in data centers, where they provide high-performance, low-latency switching to support modern workloads, virtualization, and cloud computing environments.
Nexus switches operate using NX-OS, a purpose-built operating system optimized for data center needs.
These switches support technologies like virtual port channels (vPC), FabricPath, and Application Centric Infrastructure (ACI), which are essential for scalable and highly available data center networks.
They are not typically used in branch offices, as wireless access points, or as edge routers.

NEW QUESTION # 68
Which key sequence is used to enter the boot prompt mode when the Cisco NX-OS Software begins the software boot process?

- A. Ctrl-C
- B. Ctrl-Z
- C. Ctrl-X
- D. Ctrl-1

Answer: A

Explanation:

During the boot process of Cisco devices running NX-OS, pressing Ctrl-C at the right time will interrupt the boot sequence and bring the system to the boot loader or ROMmon mode (commonly referred to as the boot prompt).

This allows a technician to perform low-level operations such as recovering passwords, specifying an alternate boot image, or performing diagnostics.

Other options (Ctrl-X, Ctrl-Z, Ctrl-1) are not used for interrupting the boot process in Cisco NX-OS platforms.

NEW QUESTION # 69

Drag and drop the characteristics from the left onto the corresponding categories of MDS switch on the right.

Answer:

Explanation:

Explanation:

Cisco MDS switches are segmented into two key categories: Director-Class and Fabric Switches, each tailored for different SAN environments:

Director-Class Switches (e.g., Cisco MDS 9700 Series):

Modular and highly scalable

Support hot-swappable components (line cards, supervisors, fabric modules) High port density and performance for core SANs in enterprise data centers Fabric Switches (e.g., Cisco MDS 9148T):

Compact, fixed-form factor

Best suited for smaller SANs or edge locations

Cost-effective and simple to deploy

This distinction is important when selecting hardware for data center core vs access layers in SAN architectures.

NEW QUESTION # 70

Which layer of the OSI model provides error detection and defines how access to the media is controlled?

- A. Presentation layer
- B. Physical layer
- C. Data link layer
- D. Network layer

Answer: C

Explanation:

The Data Link Layer (Layer 2) of the OSI model is responsible for node-to-node data transfer and plays a crucial role in error detection and media access control. It ensures that data frames are transmitted to the correct device on a local network segment.

This layer is divided into two sublayers:

Logical Link Control (LLC): Manages frame synchronization, flow control, and error checking.

Media Access Control (MAC): Controls how devices on the network gain access to the medium and permission to transmit data.

Together, these sublayers ensure reliable data transmission by detecting and possibly correcting errors that may occur in the Physical Layer. They also manage how devices share the transmission medium, preventing collisions and ensuring orderly communication.

NEW QUESTION # 71

What does OIR stand for in the context of Cisco ASR component replacement?

- A. Operational Interface Redundancy
- B. Online Insertion and Removal
- C. Offline Installation and Reboot
- D. Optical Interface Routing

Answer: B

Explanation:

Online Insertion and Removal (OIR) is a feature supported by Cisco ASR routers that allows for the insertion and removal of hardware components, such as line cards and modules, while the router is operating. This capability enables maintenance and upgrades without the need to power down the system, thus minimizing network downtime.

Key aspects of OIR include:

Seamless Operation: OIR allows for hardware changes without interrupting the router's operation.

Preservation of Routing Information: The router maintains all routing information and active sessions during the insertion or removal process.

Administrative Shutdown: While not mandatory, it is recommended to administratively shut down the interfaces associated with the component being removed to ensure a graceful transition.

This feature is particularly beneficial in high-availability environments where maintaining continuous network service is critical.
