ServiceNow CAD Exam Dumps

Our website provides the most up-to-date and accurate CAD dumps torrent which are the best for passing certification test. It will help you to accelerate your knowledge and improve your professional ability by using our CAD VCE Dumps. We are so proud of helping our candidates go through CAD real exam in their first attempt quickly. The pass rate of our products increased last year

because of its reliability.

ServiceNow CAD certification exam is a comprehensive test that covers a wide range of topics related to the ServiceNow platform. CAD exam is designed to evaluate the candidate's knowledge and skills in various areas such as ServiceNow architecture, application design, data model, scripting, integrations, and security. CAD Exam is conducted online and consists of multiple-choice questions.

ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q10-Q15):

NEW QUESTION # 10

Which platform feature can be used to determine the relationships between field in an Import Set table to field in an existing ServiceNow table?

- A. Data Sources
- B. Business Service Management Map
- C. CI Relationship Builder
- D. **Transform Map**

Answer: D

Explanation:

A transform map determines the relationships between fields displaying in an Import Set table and fields in an existing ServiceNow table, such as the Incidents or Users table.

Reference:

The following platform feature can be used to determine the relationships between fields in an Import Set table to fields in an existing ServiceNow table:

Transform Map. This is a feature that defines the mapping between the fields of an Import Set table and the fields of a target table, such as incident, problem, or user. A transform map also specifies the logic and rules for transforming the imported data, such as coalescing, scripting, or applying data policies.

The following platform features are not used to determine the relationships between fields in an Import Set table to fields in an existing ServiceNow table:

Business Service Management Map. This is a feature that provides a graphical representation of the configuration items (CIs) and their relationships in the Configuration Management Database (CMDB). A Business Service Management Map can be used to visualize the impact of incidents, changes, or problems on the CIs and the services they support.

Data Sources. This is a feature that defines the connection and authentication information for an external data source, such as a file, a JDBC database, or a web service. A data source is used to import data from the external source into an Import Set table.

CI Relationship Builder. This is a feature that creates relationships between CIs in the CMDB based on predefined or custom rules. A CI Relationship Builder can be used to populate the CMDB with the dependencies and connections between the CIs. References: Transform Maps, Business Service Management Map, Data Sources, CI Relationship Builder

NEW QUESTION # 11

What field type would you select if you want to query records from another table on a form?

- A. Use the String field type.
- B. Use the Phone Number field type.
- C. **Use the Reference field type.**
- D. Use the Date field type.

Answer: C

Explanation:

In ServiceNow, to include data from another table within a form, the Reference field type is utilized. A Reference field creates a relationship between the current table and another table by storing a reference to a record in the target table. This allows users to select a record from the referenced table and display related information seamlessly within the form.

* A. Use the Date field type: This is incorrect. The Date field type is designed to store date values and does not facilitate referencing records from other tables.

* B. Use the Phone Number field type: This is incorrect. The Phone Number field type is intended for storing phone number data and does not support referencing other table records.

* C. Use the String field type: This is incorrect. The String field type stores text data and does not inherently provide functionality to

reference records from other tables.

* D. Use the Reference field type: This is correct. The Reference field type is specifically designed to create a link to a record in another table, enabling the incorporation of related data into the form.

For example, in the Incident table, the "Caller" field is a reference to the User [sys_user] table, allowing the selection of a user as the caller for the incident. This setup ensures data consistency and leverages existing records without data duplication.

For more detailed information, refer to the official ServiceNow documentation on Reference Fields.

NEW QUESTION # 12

What occurs when an existing table is extended in ServiceNow?

- A. The new table does not inherit any of the fields from the parent table.
- B. The table's Access Controls are ignored when determining access to the new table's records and fields.
- **C. The new table inherits the functionality built into the parent table.**
- D. You must script and configure all required behaviors.

Answer: C

Explanation:

Table Extension in ServiceNow:

Extending a table in ServiceNow means creating a child table based on a parent table. The child table inherits the fields, configurations, and functionality of the parent table.

What is Inherited:

Fields: All fields from the parent table are available in the child table.

Functionality: The child table benefits from any business logic or workflows defined for the parent table.

Access Controls: The child table respects the Access Control rules defined for the parent table unless explicitly overridden.

Why Other Options Are Incorrect:

Option B: This is incorrect because the new table does inherit fields from the parent table.

Option C: This is incorrect because you do not need to script or configure behaviors from scratch; they are inherited.

Option D: This is incorrect because Access Controls are not ignored; they still apply and can be extended or modified for the child table.

Reference:

ServiceNow Developer Documentation on Table Inheritance.

NEW QUESTION # 13

Which actions can a Business Rule take without scripting?

- A. Set field values and write to the system log
- **B. Set field values and generate an event**
- C. Set field values and query the database
- D. Set field values and add message

Answer: B

Explanation:

A Business Rule can take actions such as setting field values and generating an event without scripting. A Business Rule is a server-side script that runs when a record is displayed, inserted, updated, deleted, or queried. A Business Rule can use filter conditions, role conditions, and actions to define when and how it should run. Actions are predefined operations that can be performed on a record, such as setting field values, generating an event, adding a message, or writing to the system log. These actions do not require scripting and can be selected from a drop-down list. Reference: Use business rules and client scripts to control field values

NEW QUESTION # 14

There is a basic strategy when creating a Utils Script Include. Identify the step that does not belong.

- A. Create a class
- **B. Identify the table**
- C. Script the function(s)
- D. Create a prototype object from the new class

Answer: B

NEW QUESTION # 15

ServiceNow CAD exam dumps certification will not only improve the quality of your resume, but it can open the door to new opportunities for employment. It is compulsory to prepare with reliable and valid CAD dumps that ensures 100% success on the very first attempt.
