CrowdStrike Certified Cloud Specialist Sample Questions (Q315-Q320):

NEW QUESTION # 315

You are setting up registry credentials for Falcon Cloud Security to assess images from an approved registry. What is the best practice to follow when managing these credentials?

- A. Share the credentials across multiple teams for ease of use.
- B. Store the credentials in plain text within the configuration file.
- C. Use a service account with minimal permissions to generate the credentials.
- D. Use default admin credentials for simplicity during setup.

Answer: C

Explanation:

Option A: Storing credentials in plain text poses a significant security risk. Credentials should always be encrypted or securely stored using tools like AWS Secrets Manager or HashiCorp Vault.

Option B: Sharing credentials across multiple teams violates the principle of least privilege and increases the risk of unauthorized access.

Option C: Using default admin credentials is highly insecure and can lead to unauthorized access if the credentials are compromised.

Option D: Best practices recommend using a service account with the least privilege necessary to reduce the risk of over-privileged access in case of a breach. This ensures security while granting Falcon Cloud Security access for image assessments.

NEW QUESTION # 316

Your organization wants to integrate the Falcon CWPP Image Scanning Script into its CI/CD pipeline to ensure container images are assessed for vulnerabilities before deployment.

What is the first step in configuring this integration?

- A. Manually scan images using the falcon-image-scan CLI command.
- B. Create a service account with read-only permissions in your container registry.
- C. Generate a YAML configuration file for the CI/CD pipeline.
- D. Obtain the Falcon API Client ID and Secret for authentication.

Answer: D

Explanation:

Option A: While manual scanning may be used for testing purposes, it does not integrate the script into the CI/CD pipeline. Moreover, manual scanning bypasses the automation goal of CI/CD integration.

Option B: This step is required later when integrating the scanning process into the CI/CD pipeline, but it is not the first step. Without proper authentication, subsequent steps cannot be completed.

Option C: A service account may be needed to access container images stored in the registry, but it is not a prerequisite for integrating the Falcon Image Scanning Script. Authentication with the Falcon platform takes precedence.

Option D: The Falcon API Client ID and Secret are required to authenticate with the CrowdStrike Falcon platform. This step is essential for establishing communication between the Image Scanning Script and the Falcon platform to retrieve scanning policies and report results. Without proper authentication, the script cannot access necessary resources or execute vulnerability scans.

NEW QUESTION # 317

What can you use to specify which assets to check against IOMs and Image assessment policies while leveraging the Falcon Kubernetes Admission Controller?

- A. Pod or Service labels only
- B. Namespaces and Pod or Service labels

- C. Namespaces only

Answer: B

Explanation:

When using the Falcon Kubernetes Admission Controller, CrowdStrike allows administrators to precisely scope which Kubernetes assets are evaluated against Indicators of Misconfiguration (IOMs) and Image Assessment policies by using both namespaces and pod or service labels.

Namespaces provide a logical boundary within Kubernetes clusters, often representing environments such as dev, staging, or production. Labels add further granularity by identifying workloads based on application, team ownership, or deployment tier. By combining namespaces and labels, security teams can enforce policies with fine-grained control while minimizing unintended enforcement.

Using only namespaces or only labels limits flexibility and may lead to over- or under-enforcement.

CrowdStrike documentation supports the combined approach as a best practice for scalable and precise policy enforcement in Kubernetes environments.

Therefore, the correct answer is Namespaces and Pod or Service labels.

NEW QUESTION # 318

You are investigating IOAs found in your cloud environment after a security breach. You must find any IOAs signifying that the threat actor has used techniques to maintain access to your cloud resources.

What filter on the IOA dashboard can you use to only view these specific IOAs?

- A. Privilege Escalation
- B. Execution
- C. Ransomware
- **D. Persistence**

Answer: D

Explanation:

In CrowdStrike Falcon Cloud Security, IOAs are categorized using MITRE ATT&CK-aligned tactics to help analysts quickly identify attacker objectives. When investigating how a threat actor may have maintained access to cloud resources after an initial breach, the appropriate tactic to focus on is Persistence.

Persistence IOAs represent techniques such as creating backdoor IAM roles, modifying access policies, adding API keys, enabling long-lived credentials, or altering cloud configurations to survive reboots or credential rotation. Filtering the IOA dashboard by Persistence isolates these behaviors, enabling faster root-cause analysis and remediation.

Other filters serve different investigative purposes. Execution focuses on initial code execution, Privilege Escalation highlights elevation of permissions, and Ransomware identifies encryption-related activity. None of these specifically address long-term access maintenance.

Therefore, filtering by Persistence is the correct and most effective way to identify IOAs related to maintaining access within cloud environments.

NEW QUESTION # 319

You are setting up CrowdStrike to assess images in your container registry. What is the first step to establish a connection for image scanning?

- A. Enable automatic image scanning in the image registry without additional configuration.
- **B. Register the image registry's credentials in the CrowdStrike Falcon console.**
- C. Configure an API key in the CrowdStrike Falcon console and provide it to the image registry.
- D. Enable CrowdStrike image scanning through the cloud provider's default security settings.

Answer: B

Explanation:

Option A: Cloud provider default settings don't automatically support CrowdStrike integration. You need to explicitly configure and register the registry with CrowdStrike.

Option B: While API keys may be used for other integrations, the process of registering a connection involves providing the registry's credentials to CrowdStrike, not the other way around.

Option C: Automatic image scanning by the registry itself doesn't integrate with CrowdStrike. You must explicitly connect the

registry to CrowdStrike for its scanning capabilities to be utilized.

Option D: To establish a connection for image scanning, you need to register the image registry in the CrowdStrike Falcon console. This involves providing the registry's credentials and configuration details, enabling CrowdStrike to access and scan images securely. This step establishes trust and ensures compatibility between the registry and CrowdStrike.

NEW QUESTION # 320

.....

Most of the materials on the market do not have a free trial function. Even some of the physical books are sealed up and cannot be read before purchase.
