

Varieties of Microsoft DP-300 Exam Practice Test Questions

P.S. Free 2026 Microsoft DP-300 dumps are available on Google Drive shared by Itcertmaster: <https://drive.google.com/open?id=14sy6LW2PIYovpRBpM2lpHeF8-h3P5PP9>

Itcertmaster DP-300 latest training guide covers all the main content which will be tested in the actual exam. Even if, there may occur few new questions, you still do not worry, because the content of Microsoft DP-300 latest free pdf will teach you the applicable knowledge which will help you solve the problem. So please rest assured to choose DP-300 Valid Test Questions vce, high pass rate will bring you high score.

Microsoft DP-300 (Administering Relational Databases on Microsoft Azure) certification exam is designed for professionals looking to validate their skills and expertise in administering relational databases on Microsoft Azure. DP-300 Exam focuses on testing candidates' ability to manage and maintain database environments in the cloud, including data backup and recovery, security and compliance, performance tuning, and monitoring.

DP-300 Authorized Certification, Authorized DP-300 Exam Dumps

Preparing for the Administering Relational Databases on Microsoft Azure (DP-300) certification test can be a difficult task for candidates. They often face several challenges during their preparation for the Administering Relational Databases on Microsoft Azure (DP-300) exam, including fear, lack of updated DP-300 Exam Dumps, and time constraints. Fortunately, there is a solution to these challenges. Itcertmaster is a reliable website that provides genuine and updated DP-300 Practice Test.

Microsoft Administering Relational Databases on Microsoft Azure Sample Questions (Q76-Q81):

NEW QUESTION # 76

You have an Azure Synapse Analytics workspace named WS1 that contains an Apache Spark pool named Pool1.

You plan to create a database named DB1 in Pool1.

You need to ensure that when tables are created in DB1, the tables are available automatically as external tables to the built-in serverless SQL pool.

Which format should you use for the tables in DB1?

- A. JSON
- **B. Parquet**
- C. ORC
- D. CSV

Answer: B

Explanation:

Section: [none]

Explanation:

Serverless SQL pool can automatically synchronize metadata from Apache Spark. A serverless SQL pool database will be created for each database existing in serverless Apache Spark pools.

For each Spark external table based on Parquet and located in Azure Storage, an external table is created in a serverless SQL pool database. As such, you can shut down your Spark pools and still query Spark external tables from serverless SQL pool.

Reference:

<https://docs.microsoft.com/en-us/azure/synapse-analytics/sql/develop-storage-files-spark-tables>

NEW QUESTION # 77

You have the following Azure Resource Manager template.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

<https://docs.microsoft.com/en-us/azure/azure-sql/database/single-database-create-arm-template-quickstart>

NEW QUESTION # 78

You have an Azure SQL Database instance named DatabaseA on a server named Server1.

You plan to add a new user named App1 to DatabaseA and grant App1 db_datacenter permissions. App1 will use SQL Server Authentication.

You need to create App1. The solution must ensure that App1 can be given access to other databases by using the same credentials.

Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Answer:

Explanation:

Explanation:

Step 1: On the master database, run CREATE LOGIN [App1] WITH PASSWORD = 'p@aaW0rd!' Logins are server wide login and password pairs, where the login has the same password across all databases.

Here is some sample Transact-SQL that creates a login:

```
CREATE LOGIN readonlylogin WITH password='1231!#ASDF!a';
```

You must be connected to the master database on SQL Azure with the administrative login (which you get from the SQL Azure portal) to execute the CREATE LOGIN command.

Step 2: On DatabaseA, run CREATE USER [App1] FROM LOGIN [App1]

Users are created per database and are associated with logins. You must be connected to the database in where you want to create the user. In most cases, this is not the master database. Here is some sample Transact-SQL that creates a user:

```
CREATE USER readonlyuser FROM LOGIN readonlylogin;
```

Step 3: On DatabaseA run ALTER ROLE db_datareader ADD Member [App1]

Just creating the user does not give them permissions to the database. You have to grant them access. In the Transact-SQL example below the readonlyuser is given read only permissions to the database via the db_datareader role.

```
EXEC sp_addrolemember 'db_datareader', 'readonlyuser';
```

NEW QUESTION # 79

You have an Azure subscription that contains an Azure SQL managed instance named SQLMI1. You need to configure SQLMI1 to use the Business Critical service tier Which PowerShell cmdlet should you run?

- A. Set-AzSqlInstance
- B. Set-AzSqlDatabase
- C. Set-AzSqlServerConfigurationOption
- D. Update-SqlVM

Answer: A

NEW QUESTION # 80

You configure version control for an Azure Data Factory instance as shown in the following exhibit.

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.

NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation:

Box 1: adf_publish

By default, data factory generates the Resource Manager templates of the published factory and saves them into a branch called adf_publish. To configure a custom publish branch, add a publish_config.json file to the root folder in the collaboration branch. When publishing, ADF reads this file, looks for the field publishBranch, and saves all Resource Manager templates to the specified location. If the branch doesn't exist, data factory will automatically create it. An example of what this file looks like is below:

```
{
  "publishBranch": "factory/adf_publish"
}
```

Box 2: /dwh_barchlet/ adf_publish/contososales

RepositoryName: Your Azure Repos code repository name. Azure Repos projects contain Git repositories to manage your source code as your project grows. You can create a new repository or use an existing repository that's already in your project.
