Topic	Details

Topic 1	Plan and Design the VMware by Broadcom Solution: This section of the exam measures the ability of VMware Solution Architects to plan and design solutions. While there are no specific testable objectives included, the focus is on preparing professionals to design VMware-based solutions that align with organizational goals and best practices.
Topic 2	IT Architectures, Technologies, Standards: This section of the exam measures the understanding of IT Infrastructure Architects and covers foundational concepts of architectures, emerging technologies, and industry standards. Although no testable objectives are listed here, it establishes the baseline knowledge needed to interpret and design VMware-related environments effectively.
Topic 3	VMware vSphere Foundation Fundamentals: This section of the exam measures the skills of Virtualization Engineers and focuses on the essentials of virtualization technology. It introduces the principles of virtualization, explores use cases, and highlights the value it brings to businesses. Candidates are expected to demonstrate knowledge of VMware compute components such as vCenter and ESX, cluster configuration, and lifecycle management of virtual machines. It also covers secure workload operations, encryption, and managing resources with content libraries. In addition, storage fundamentals are examined through configuring vSphere storage, deploying VMware vSAN clusters, defining storage policies, and ensuring data availability. Networking fundamentals are also introduced, requiring the ability to differentiate between VMware vSphere networking components.
Topic 4	Troubleshoot and Optimize the VMware Solution: This section of the exam measures the ability of Systems Engineers to troubleshoot and optimize VMware-based environments. While no explicit testable objectives are listed, candidates are expected to apply their problem-solving skills to diagnose, resolve, and enhance VMware solutions for improved reliability and performance.
Topic 5	Deploy, Configure, and Operate VMware vSphere Foundation (VVF): This section of the exam measures the expertise of Data Center Administrators and emphasizes hands-on skills in deploying and configuring VMware vSphere Foundation environments. Candidates must understand the components of a VVF deployment, configure Supervisors within clusters, and manage identity, access control, licensing, and certificate management. The objectives also extend to lifecycle management within the vSphere Foundation. Furthermore, it explores operational tasks including monitoring and analyzing logs, configuring alerting, managing dashboards, and integrating with VMware Cloud Foundation (VCF) Operations. Candidates will also be tested on cost and pricing configuration, compliance monitoring, and security hardening practices. Finally, automation skills are validated through deploying services with Supervisors, running Kubernetes workloads, using VM services, and integrating VCF Operations Orchestrator to support enterprise automation.

VMware vSphere Foundation 9.0 Administrator Sample Questions (Q46-Q51):

NEW QUESTION # 46

An administrator is tasked to create a new storage policy for an eight-node VMware vSAN Original Storage Architecture (OSA) cluster.

The following specifications have been provided:

- * Tolerate up to two host failures.
- * Ensure maximum usable capacity.

Which storage policy settings must the administrator configure?

- A. 1 failure - RAID-5
- B. 3 failures - RAID-1
- C. 2 failures - RAID-5
- D. 1 failure - RAID-1

Answer: C

Explanation:

For an 8-node vSAN OSA cluster, the administrator needs a storage policy that:

- * Tolerates 2 host failures, and

- * Provides maximum usable capacity.
- * RAID-5/6 (erasure coding) is more capacity-efficient than RAID-1 mirroring.
- * To tolerate 2 failures, the correct policy is RAID-5 with FTT=2.
- * RAID-1 (mirroring) would consume far more capacity, reducing usable space.

Other options:

- * A. 1 failure - RAID-1# Only tolerates one failure.
- * C. 3 failures - RAID-1# Provides higher resilience but uses much more capacity, not maximum efficiency.
- * D. 1 failure - RAID-5# Tolerates only one failure.

NEW QUESTION # 47

Which rule in a virtual machine (VM) storage policy is configured to ensure data redundancy in a VMware vSAN environment?

- A. Flash Read Cache Reservation
- B. Stripe Width
- C. Disk Stripes Per Object
- **D. Failures to Tolerate**

Answer: D

Explanation:

The VM Storage Policy rule that controls data redundancy in vSAN is Failures to Tolerate (FTT).

- * Defines the number of hardware failures (host, disk, network) that vSAN can tolerate while maintaining data availability.
- * Configurations include RAID-1 (mirroring), RAID-5/6 (erasure coding).

Other options:

- * B. Disk Stripes Per Object# Defines performance striping, not redundancy.
- * C. Stripe Width# Same as above, not redundancy.
- * D. Flash Read Cache Reservation# Relates to caching performance, not redundancy.

NEW QUESTION # 48

An administrator has enabled a Supervisor on a vSphere cluster. The DevOps team has requested access to vSphere resources such as virtual machines, storage, and networking using Kubernetes tooling. To meet this request, the administrator must provide secure, policy-based access that sets clear boundaries for compute and storage consumption.

Which function is provided by Supervisor services to support this use case?

- A. Grant DevOps users administrator access to the vCenter Server system namespace.
- B. Enable virtual machine backup using native Kubernetes ConfigMaps.
- **C. Allow access to vSphere resources through Kubernetes in a configured Supervisor Namespace.**
- D. Enable vSphere Replication between Supervisor Namespaces.

Answer: C

Explanation:

When Supervisor is enabled:

- * It provides Supervisor Namespaces, which grant DevOps teams secure, policy-based access to vSphere resources (VMs, storage, networking) through Kubernetes tooling.
- * This enforces boundaries and quotas for compute/storage consumption.

Other options:

- * B. VM backup via ConfigMaps# Not a feature of Supervisor.
- * C. vSphere Replication between namespaces# Not a Supervisor function.
- * D. Granting administrator access to vCenter system namespace# Violates least-privilege security.

NEW QUESTION # 49

What is the benefit of enabling lockdown mode on VMware ESX hosts?

- A. Increases CPU and memory resources available to virtual machines (VMs).
- B. Simplifies the management of virtual machines.
- C. Improves network performance.
- D. Restricts direct access to the ESX host, enhancing security.

Answer: D

Explanation:

Lockdown Mode on ESXi hosts is a security feature that restricts direct login to the ESXi host.

* Once enabled, administrators must manage the host through vCenter Server instead of direct DCUI/SSH access (except for exception users).

* This prevents unauthorized local access and improves overall security compliance.

Other options:

* A. Improves network performance# Not related.

* C. Increases CPU/memory for VMs# Not related.

* D. Simplifies VM management# It actually makes direct management more restricted.

NEW QUESTION # 50

Which component must be added after an initial deployment of VMware vSphere Foundation (VVF) to provide a central location for logs collection?

- A. VCF Operations
- B. Fleet Manager
- C. VCF Operations for Networks
- D. VCF Operations for Logs

Answer: D

Explanation:

After deploying vSphere Foundation, to centralize log collection and analysis, you must add:

* VCF Operations for Logs, which provides log ingestion, alerting, and centralized troubleshooting.

Other options:

* B. VCF Operations# Focuses on performance/capacity, not log collection.

* C. VCF Operations for Networks# Focuses on networking insights.

* D. Fleet Manager# Used for multi-instance management, not logging.
