- C. Edit the Change Server fields during the deployment process.
- D. Edit the Server Connectivity settings in the Tools menu in Pega Robot Studio.
- E. Rerun the Pega Robot Studio installation and configure the server settings.

정답: A,C,D

설명:

Comprehensive and Detailed Explanation From Pega Robotics System Exact Extract:

Pega Robot Studio provides multiple ways to configure or modify Pega Server connectivity settings used for Robot Manager deployment. These settings define the server URL, operator credentials, and authentication method.

According to the Pega Robotics System Design and Implementation Guide, section "Configuring Pega Server Connectivity":

"Server connectivity settings can be specified in multiple ways within Pega Robot Studio:

* During the initial installation process, when prompted to enter Robot Manager URL and credentials.

* By navigating to the Tools # Options # Server Connectivity menu to edit or test server details.

* By adjusting the Change Server fields that appear during the deployment process to override existing configurations. Manual editing of XML files is not recommended for changing server connectivity settings." Detailed Reasoning:

* A. Edit the Change Server fields during the deployment process - Correct. The deployment wizard allows adjusting or overriding existing server settings.

* B. Configure the server settings during the initial installation of Pega Robot Studio - Correct. The installation wizard prompts for server setup.

* C. Rerun the Pega Robot Studio installation and configure the server settings - Not necessary unless reinstallation is required.

* D. Manually edit the PegaStudioConfig.xml file - Not recommended or supported for changing connectivity.

* E. Edit the Server Connectivity settings in the Tools menu in Pega Robot Studio - Correct. This is the standard interface to modify or test connection settings.

질문 # 19

A developer working on an automation has added a diagnostic log component to check the following log file for information on inconsistent behavior.

Based on the image, which category and log level did the developer configure for the diagnostic log component in the automation?

- A. Category: Automation; Log Level: Warning
- B. Category: Adapters; Log Level: Info
- C. Category: Automation; Log Level: Info
- D. Category: Adapters; Log Level: Warning

정답 : D

설명:

The Pega Robot Studio Diagnostic Log captures runtime execution events, categorized by functional area and severity level.

Each log entry provides five primary columns:

* Type (Log Level) - Indicates severity (INFO, WARN, ERROR, etc.)

* Category - Specifies which subsystem or component produced the log (Adapters, Automation, Runtime, etc.)

* Message - Contains the diagnostic details or error description

According to the Pega Robotics System Design and Implementation Guide, section "Diagnostic Logging and Log Levels":

"The diagnostic log component allows developers to record runtime information filtered by category and severity.

Categories correspond to major system components such as Automation, Adapters, Runtime, and Windows Adapter.

Log levels include INFO, WARN, ERROR, and DEBUG.

Setting the diagnostic log component to 'Adapters' and level 'Warning' captures warnings related to adapter startup, attachment, and runtime communication." Detailed Reasoning:

From the image:

* The Type column shows: WARN (highlighted entry).

* The Category column shows: Adapters.

* The Message reads: DialogMonitorHelper.StartMonitoring: Timed out waiting 2000 milliseconds for dialog monitor to start.

This message indicates a timeout in the adapter's dialog monitoring mechanism - a typical warning-level event in the Adapter category.
