We believe that you don't encounter failures anytime you want to learn our Terraform-Associate-003 guide torrent.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q42-Q47):

NEW QUESTION # 42
Terraform variables and outputs that set the description argument will store that description in the state file.

- A. False
- B. True

Answer: A

Explanation:
The description argument for Terraform variables and outputs is purely for documentation purposes and isnotstored in the Terraform state file.
* Terraform variables and outputs can have descriptions for readability and clarity in .tf files.
* However, these descriptions are not retained in the Terraform state file.
* The state file only stores actual values and references needed for resource management, not metadata such as descriptions.
Official Terraform Documentation Reference:
Terraform Variables - HashiCorp Documentation
Terraform Outputs - HashiCorp Documentation

NEW QUESTION # 43
Which provider authentication method prevents credentials from being stored in the state file?

- A. Setting credentials as Terraform variables
- B. Using environment variables
- C. None of the above
- D. Specifying the login credentials in the provider block

Answer: C

Explanation:
None of the above methods prevent credentials from being stored in the state file. Terraform stores the provider configuration in the state file, which may include sensitive information such as credentials. This is a potential security risk and should be avoided if possible. To prevent credentials from being stored in the state file, you can use one of the following methods:
Use environment variables to pass credentials to the provider. This way, the credentials are not part of the provider configuration and are not stored in the state file. However, this method may not work for some providers that require credentials to be set in the provider block.
Use dynamic credentials to authenticate with your cloud provider. This way, Terraform Cloud or Enterprise will request temporary credentials from your cloud provider for each run and use them to provision your resources. The credentials are not stored in the state file and are revoked after the run is completed. This method is supported for AWS, Google Cloud Platform, Azure, and Vault.
References = : [Sensitive Values in State] : Authenticate providers with dynamic credentials

NEW QUESTION # 44
Which of these sources can Terraform use to download modules?

- A. Local path
- B. GitHub repository
- C. HTTP URLs
- D. Terraform Registry
- E. All of the above

Answer: E

Explanation:
Detailed Explanation:
* Rationale for Correct answer:Terraform supports downloading modules from multiple sources, including:
* Local file paths
* Git repositories (e.g., GitHub)
* Terraform Registry
* Direct HTTP URLs
Therefore, all listed sources are valid.
* Analysis of Incorrect Options (Distractors):
* A-D: Each is valid individually, but incomplete alone.
* E: Correct because it encompasses all supported sources.
* Key Concept:Terraform modules are flexible and source-agnostic, supporting multiple retrieval methods.
Reference:Terraform Exam Objective - Interact with Terraform Modules

NEW QUESTION # 45
You are writing a child Terraform module that provisions an AWS instance. You want to reference the IP address returned by the child module in the root configuration. You name the instance resource "main'.
Which of these is the correct way to define the output value?
A)
B)
C)
D)

- A. Option A
- B. Option D
- C. Option B
- D. Option C

Answer: B

NEW QUESTION # 46
You add a new resource to an existing Terraform configuration, but do not update the version constraint in the configuration. The existing and new resources use the same provider. The working contains a .terraform.lock, hc1 file.
How will Terraform choose which version of the provider to use?

- A. Terraform will use the latest version of the provider available at the time you provision your new resource
- B. Terraform will check your state file to determine the provider version to use
- C. Terraform will use the latest version of the provider for the new resource and the version recorded in the lock file to manage existing resources
- D. Terraform will use the version recorded in your lock file

Answer: D

Explanation:
This is how Terraform chooses which version of the provider to use, when you add a new resource to an existing Terraform configuration, but do not update the version constraint in the configuration. The lock file records the exact version of each provider that was installed in your working directory, and ensures that Terraform will always use the same provider versions until you run terraform init -upgrade to update them.

NEW QUESTION # 47
.....

If you are busy with your work and study and have little time to prepare for your exam, then choose us, we can do the rest for you.
