更新的Oracle 最新1z0-1127-24考證是行業領先材料&有效的1z0-1127-24: Oracle Cloud Infrastructure 2024 Generative AI Professional

我們NewDumps提供下載的Oracle的1z0-1127-24的問題範例，使你購買無風險的過程，這是一個使用版的練習題，讓你看得到界面的友好，問題的品質，以及在你決定購買之前的價值，我們有信心，我們NewDumps Oracle的1z0-1127-24的樣品足以定性，成為讓你滿意的產品。為了保證你的權益，NewDumps承諾一次不過，將退還購買費用。我們的目的是不僅僅使你通過IT考試，更希望你能成為一名真正的IT認證專家，為你的求職增加砝碼，獲得與自身技術水準相符的技術崗位，輕鬆的跨入IT白領階層獲取高薪。

最新的 Oracle Cloud Infrastructure 1z0-1127-24 免費考試真題 (Q10-Q15):

問題 #10

Why is it challenging to apply diffusion models to text generation?

- A. Because diffusion models can only produce images
- B. Because text is not categorical
- C. Because text representation is categorical unlike images
- D. Because text generation does not require complex models

答案: C

解題說明:

Diffusion models are primarily used for image generation because they work by incrementally adding noise to a data distribution and then learning to remove it, effectively denoising an image over time. This method works well for continuous data, such as pixel values in images.

However, text is fundamentally categorical, meaning:

Discrete Nature of Text - Unlike images where pixel values change smoothly, text is composed of discrete symbols (words, characters, or tokens), making it difficult to apply continuous noise diffusion.

Tokenization Challenges - Language models work with tokenized words or subwords. Diffusion models would need a way to gradually transition between discrete text tokens, which is not straightforward.

Non-Sequential Nature of Noise Addition - Image-based diffusion models can modify pixel values slightly to learn transformations, but text does not have an equivalent smooth transformation between words.

Alternative Approaches in Text Generation - Due to these challenges, text generation relies more on transformer-based models (like Oracle's AI-driven NLP models), which handle categorical text more effectively than diffusion methods.

□ Oracle Generative AI Reference:

Oracle focuses on transformer-based models for text-related AI applications rather than diffusion models, as transformers are more effective in understanding and generating text.

問題 #11

How does the temperature setting in a decoding algorithm influence the probability distribution over the vocabulary?

- A. Decreasing the temperature broadens the distribution, making less likely words more probable.
- B. Increasing the temperature removes the impact of the most likely word.
- C. Increasing the temperature flattens the distribution, allowing for more varied word choices.
- D. Temperature has no effect on probability distribution; it only changes the speed of decoding.

答案: C

解題說明:

Temperature is a parameter in LLM decoding algorithms that controls randomness in text generation.

Effects of Temperature on Text Generation:

Higher Temperature (>1.0):

Flattens the probability distribution, making lower-probability words more likely.

Increases randomness, resulting in more creative and diverse outputs.

Lower Temperature (<1.0):

Sharpening effect, making high-probability words more dominant.

Produces more predictable and deterministic responses.

Why Other Options Are Incorrect:

(B) is incorrect because temperature does not remove the impact of likely words; it reduces or increases randomness.

(C) is incorrect because temperature affects probability, not speed.

(D) is incorrect because decreasing the temperature narrows the distribution, making text more deterministic.

□ Oracle Generative AI Reference:

Oracle AI models allow dynamic temperature control to balance coherence and creativity in text generation.

問題 #12

In LangChain, which retriever search type is used to balance between relevancy and diversity?

- A. similarity_score_threshold
- B. mmr
- C. similarity
- D. top k

答案: C

問題 #13

What does a cosine distance of 0 indicate about the relationship between two embeddings?

- A. They are similar in direction
- B. They are completely dissimilar
- C. They have the same magnitude
- D. They are unrelated

答案：A

問題 #14

Which statement best describes the role of encoder and decoder models in natural language processing?

- A. Encoder models are used only for numerical calculations, whereas decoder models are used to interpret the calculated numerical values back into text.
- **B. Encoder models convert a sequence of words into a vector representation, and decoder models take this vector representation to sequence of words.**
- C. Encoder models take a sequence of words and predict the next word in the sequence, whereas decoder models convert a sequence of words into a numerical representation.
- D. Encoder models and decoder models both convert sequence* of words into vector representations without generating new text.

答案：B
