Prepare with updated ServiceNow CAD dumps - Get up to one year of free updates

In the major environment, people are facing more job pressure. So they want to get ServiceNow certification rise above the common herd. How to choose valid and efficient CAD guide torrent should be the key topic most candidates may concern. So now, it is right, you come to us. Our company is famous for its high-quality CAD Exam Questions in this field especially for ServiceNow certification exams. It has been accepted by thousands of candidates who practice our CAD study materials for their exam.

ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q69-Q74):

NEW QUESTION # 69
Which one of the following is true for this script fragment?
g_user.hasRole(,x_my_app_user');

- A. There is no g_user.hasRole() method
- B. The method returns true if the currently logged in user has the x_my_app_user role or the admin role
- C. The method returns true only if the currently logged in user has the x_my_app_user role
- D. The method returns false only if the currently logged in user has the x_my_app_user role

Answer: B

Explanation:
The statement that is true for this script fragment is that the method returns true if the currently logged in user has the x_my_app_user role or the admin role. The g_user.hasRole() method is a client-side method that checks whether the current user has a specified role or set of roles. If no role is specified, it returns true if the user has any role. If one or more roles are specified, it returns true if the user has any one of the specified roles. However, this method always returns true if the user has the admin role, regardless of the role parameter.
Therefore, in this case, the method returns true if the user has either the x_my_app_user role or the admin role.

NEW QUESTION # 70
Which one of the following database operations cannot be controlled with Application Access?

- A. Update
- B. Create
- C. Query
- D. Delete

Answer: C

Explanation:
Application Access is a feature that allows you to control the access level of other application scopes to your application's data tables. You can use Application Access to control the following database operations:
Create: This operation allows the user to create new records on the table. You can enable or disable this operation by selecting or clearing the Can create option.
Delete: This operation allows the user to delete existing records on the table. You can enable or disable this operation by selecting or clearing the Can delete option.
Read: This operation allows the user to view the records on the table. You can enable or disable this operation by selecting or clearing the Can read option.
Write: This operation allows the user to modify the records on the table. You can enable or disable this operation by selecting or clearing the Can write option.
The one database operation that cannot be controlled with Application Access is Query. Query is not an operation, but a method of the GlideRecord class that is used to retrieve records from the database on the server-side. Query is not part of the Application Access rules, but it is affected by the Access Controls and the user's roles.

NEW QUESTION # 71
How must Application Access be configured to prevent all other private application scopes from creating configuration records on an application's data tables?

- A. You must create Access Controls to prevent all other application scopes from creating configuration records on an application's data tables rather than using Application Access
- B. Set the Accessible from field value to All application scopes and de-select the Can create option
- C. Set the Accessible from field value to This application scope only
- D. Set the Accessible from field value to This application scope only and de-select the Allow access to this table via web services option

Answer: A
