

# Exam ACD301 Pass Guide, PDF ACD301 Cram Exam

P.S. Free & New ACD301 dumps are available on Google Drive shared by GetValidTest: [https://drive.google.com/open?id=1QS4qVrAiyReItWdKcgmsp\\_alkj2IcH8D](https://drive.google.com/open?id=1QS4qVrAiyReItWdKcgmsp_alkj2IcH8D)

GetValidTest has hired professionals to supervise the quality of the ACD301 PDF prep material. Laptops, tablets, and smartphones support the Appian ACD301 test questions PDF file. If any taker of the Appian ACD301 test prepares thoroughly with our exam product he will crack the exam of the credential on the first attempt.

Our company made these ACD301 practice materials with accountability. We understand you can have more chances being accepted by other places and getting higher salary or acceptance. Our Appian Lead Developer training materials are made by our responsible company which means you can gain many other benefits as well. We offer ACD301 free demos for your reference, and send you the new updates if our experts make them freely. If you fail the exam after using our ACD301 exam prep unfortunately, we will switch other versions for you or return full refund.

## Fast Download Exam ACD301 Pass Guide & Leader in Qualification Exams & Excellent ACD301: Appian Lead Developer

There have been tens of thousands of our loyal customers who chose to buy our ACD301 exam questions and get their certification. These people have already had a good job opportunity and are running on their way to fulfilling their dreams after using ACD301 practice quiz! Want to be like them, you must also act! Time and tide wait for no man. And you can free download the demos of the ACD301 study guide, you can have a try before purchase.

### Appian Lead Developer Sample Questions (Q22-Q27):

#### NEW QUESTION # 22

Your Agile Scrum project requires you to manage two teams, with three developers per team. Both teams are to work on the same application in parallel. How should the work be divided between the teams, avoiding issues caused by cross-dependency?

- A. Group epics and stories by feature, and allocate work between each team by feature.
- B. Group epics and stories by technical difficulty, and allocate one team the more challenging stories.
- C. Allocate stories to each team based on the cumulative years of experience of the team members.
- D. Have each team choose the stories they would like to work on based on personal preference.

**Answer: A**

Explanation:

Comprehensive and Detailed In-Depth Explanation: In an Agile Scrum environment with two teams working on the same application in parallel, effective work division is critical to avoid cross-dependency, which can lead to delays, conflicts, and inefficiencies.

Appian's Agile Development Best Practices emphasize team autonomy and minimizing dependencies to ensure smooth progress.

\* Option B (Group epics and stories by feature, and allocate work between each team by feature):

This is the recommended approach. By dividing the application's functionality into distinct features (e.

g., Team 1 handles customer management, Team 2 handles campaign tracking), each team can work independently on a specific domain. This reduces cross-dependency because teams are not reliant on each other's deliverables within a sprint. Appian's guidance on multi-team projects suggests feature-based partitioning as a best practice, allowing teams to own their backlog items, design, and testing without frequent coordination. For example, Team 1 can develop and test customer-related interfaces while Team 2 works on campaign processes, merging their work during integration phases.

\* Option A (Group epics and stories by technical difficulty, and allocate one team the more challenging stories): This creates an imbalance, potentially overloading one team and underutilizing the other, which can lead to morale issues and uneven progress. It also doesn't address cross-dependency, as challenging stories might still require input from both teams (e.g., shared data models), increasing coordination needs.

\* Option C (Allocate stories to each team based on the cumulative years of experience of the team members): Experience-based allocation ignores the project's functional structure and can result in mismatched skills for specific features. It also risks dependencies if experienced team members are needed across teams, complicating parallel work.

\* Option D (Have each team choose the stories they would like to work on based on personal preference): This lacks structure and could lead to overlap, duplication, or neglect of critical features. It increases the risk of cross-dependency as teams might select interdependent stories without coordination, undermining parallel development.

Feature-based division aligns with Scrum principles of self-organization and minimizes dependencies, making it the most effective strategy for this scenario.

## NEW QUESTION # 23

You are selling up a new cloud environment. The customer already has a system of record for its employees and doesn't want to re-create them in Appian. so you are going to implement LDAP authentication.

What are the next steps to configure LDAP authentication?

To answer, move the appropriate steps from the Option list to the Answer List area, and arrange them in the correct order. You may or may not use all the steps.

The screenshot shows the Appian interface for configuring LDAP authentication. It consists of two main panels: 'Options' and 'Answer List'.

**Options Panel:** This panel contains five steps for configuring LDAP authentication. Each step has a title, a description, and an 'Add to answer list' button.

- Step 1: Enter two parameters: the url of the LDAP server and plaintext credentials.
- Step 2: Test the LDAP integration and save if it succeeds.
- Step 3: Navigate to the Admin Console > Authentication > LDAP.
- Step 4: Work with the customer LDAP point-of-contact to obtain the LDAP authentication xsd. Import the xsd file in the Admin Console.
- Step 5: Enable LDAP and enter the appropriate LDAP parameters, such as the URL of the LDAP server and plaintext credentials.

**Answer List Panel:** This panel is currently empty, intended for the user to move and order the selected steps.

A watermark 'getvalidtest.com' is visible across the interface.

**Answer:**

**Explanation:**

The screenshot displays the Appian Admin Console interface for LDAP configuration. It is divided into two main sections: 'Options' and 'Answer List'. The 'Options' section contains five steps in a dashed box, each with a 'Move to answer list' button. The 'Answer List' section contains the same five steps, but they are rearranged into a solid blue box to show the correct sequence. The steps are: 3. Navigate to the Admin Console > Authentication > LDAP, 4. Work with the customer LDAP point-of-contact to obtain the LDAP authentication xsd. Import the xsd file in the Admin console, 5. Enable LDAP and enter the appropriate LDAP parameters, such as the URL of the LDAP server and plaintext credentials, 2. Test the LDAP integration and save if it succeeds, and 1. Enter two parameters: the url of the LDAP server and plaintext credentials. The Appian logo is visible in the bottom left corner of the screenshot.

**Explanation:**

\* Navigate to the Admin console > Authentication > LDAP. This is the first step, as it allows you to access the settings and options for LDAP authentication in Appian.

\* Work with the customer LDAP point of contact to obtain the LDAP authentication xsd. Import the xsd file in the Admin console. This is the second step, as it allows you to define the schema and structure of the LDAP data that will be used for authentication in Appian. You will need to work with the customer LDAP point of contact to obtain the xsd file that matches their LDAP server configuration and data model. You will then need to import the xsd file in the Admin console using the Import Schema button.

\* Enable LDAP and enter the LDAP parameters, such as the URL of the LDAP server and plaintext credentials. This is the third step, as it allows you to enable and configure the LDAP authentication in Appian. You will need to check the Enable LDAP checkbox and enter the required parameters, such as the URL of the LDAP server, the plaintext credentials for connecting to the LDAP server, and the base DN for searching for users in the LDAP server.

\* Test the LDAP integration and see if it succeeds. This is the fourth and final step, as it allows you to verify and validate that the LDAP authentication is working properly in Appian. You will need to use the Test Connection button to test if Appian can connect to the LDAP server successfully.

You will also need to use the Test User Lookup button to test if Appian can find and authenticate a user from the LDAP server using their username and password.

Configuring LDAP authentication in Appian Cloud allows the platform to leverage an existing employee system of record (e.g., Active Directory) for user authentication, avoiding manual user creation. The process involves a series of steps within the Appian Administration Console, guided by Appian's Security and Authentication documentation. The steps must be executed in a logical order to ensure proper setup and validation.

\* Navigate to the Admin Console > Authentication > LDAP: The first step is to access the LDAP configuration section in the Appian Administration Console. This is the entry point for enabling and configuring LDAP authentication, where administrators can define the integration settings. Appian requires this initial navigation to begin the setup process.

\* Work with the customer LDAP point-of-contact to obtain the LDAP authentication xsd. Import the xsd file in the Admin Console: The next step involves gathering the LDAP schema definition (xsd file) from the customer's LDAP system (e.g., via their point-of-contact). This file defines the structure of the LDAP directory (e.g., user attributes). Importing it into the Admin Console allows Appian to map these attributes to its user model, a critical step before enabling authentication, as outlined in Appian's LDAP Integration Guide.

\* Enable LDAP and enter the appropriate LDAP parameters, such as the URL of the LDAP server and plaintext credentials: After importing the schema, enable LDAP and configure the connection details. This includes specifying the LDAP server URL (e.g., ldap://ldap.example.com) and plaintext credentials (or a secure alternative like LDAPS with certificates). These parameters establish the connection to the customer's LDAP system, a prerequisite for testing, as per Appian's security best practices.

\* Test the LDAP integration and save if it succeeds: The final step is to test the configuration to ensure Appian can authenticate against the LDAP server. The Admin Console provides a test option to verify connectivity and user synchronization. If successful,

saving the configuration applies the settings, completing the setup. Appian recommends this validation step to avoid misconfigurations, aligning with the iterative testing approach in the documentation.

Unused Option:

\* Enter two parameters: the URL of the LDAP server and plaintext credentials: This step is redundant and not used. The equivalent action is covered under "Enable LDAP and enter the appropriate LDAP parameters," which is more comprehensive and includes enabling the feature.

Including both would be duplicative, and Appian's interface consolidates parameter entry with enabling.

Ordering Rationale:

\* The sequence follows a logical workflow: navigation to the configuration area, schema import for structure, parameter setup for connectivity, and testing/saving for validation. This aligns with Appian's step-by-step LDAP setup process, ensuring each step builds on the previous one without requiring backtracking.

\* The unused option reflects the question's allowance for not using all steps, indicating flexibility in the process.

## NEW QUESTION # 24

You are deciding the appropriate process model data management strategy.

For each requirement, match the appropriate strategies to implement. Each strategy will be used once.

Note: To change your responses, you may deselect your response by clicking the blank space at the top of the selection list.

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

Use system default (currently: auto-archive processes 7 days after completion or cancellation).

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

Delete processes 2 days after completion or cancellation.

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

Do not automatically clean-up processes.

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

**Answer:**

**Explanation:**

Archive processes 2 days after completion or cancellation.

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

Use system default (currently: auto-archive processes 7 days after completion or cancellation).

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

Delete processes 2 days after completion or cancellation.

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

Do not automatically clean-up processes.

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.

Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.

Processes that remain available for 7 days after completion or cancellation, after which remain accessible.

Processes that need remain available without the need to unarchive.

#### NEW QUESTION # 25

You are selling up a new cloud environment. The customer already has a system of record for its employees and doesn't want to re-create them in Appian. so you are going to Implement LDAP authentication.

What are the next steps to configure LDAP authentication?

To answer, move the appropriate steps from the Option list to the Answer List area, and arrange them in the correct order. You may or may not use all the steps.

**Options**  
Move options from here to the answer list

Enter two parameters: the url of the LDAP server and plaintext credentials.

Test the LDAP integration and save if it succeeds.

Navigate to the Admin Console > Authentication > LDAP.

Work with the customer LDAP point-of-contact to obtain the LDAP authentication xsd. Import the xsd file in the Admin Console.

Enable LDAP and enter the appropriate LDAP parameters, such as the URL of the LDAP server and plaintext credentials.

**Answer List**  
Move options here and sort them into a desired order

**Answer:**

**Explanation:**

**Options**  
Move options from here to the answer list

**Answer List**  
Sort them into a desired order

appian

Enter two parameters: the url of the LDAP server and plaintext credentials.

Test the LDAP integration and save if it succeeds.

Navigate to the Admin Console > Authentication > LDAP.

Work with the customer LDAP point-of-contact to obtain the LDAP authentication xsd. Import the xsd file in the Admin Console.

Enable LDAP and enter the appropriate LDAP parameters, such as the URL of the LDAP server and plaintext credentials.

Test the LDAP integration and save if it succeeds.

Enter two parameters: the url of the LDAP server and plaintext credentials.

#### NEW QUESTION # 26

For each requirement, match the most appropriate approach to creating or utilizing plug-ins. Each approach will be used once.

Note: To change your responses, you may deselect your response by clicking the blank space at the top of the selection list.

appian

Read barcode values from images containing barcodes and QR codes.

Select a match:

- Web-content field
- Component plug-in
- Smart Service plug-in
- Function plug-in

Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to see where a customer (stored within Appian) is located.

Select a match:

- Web-content field
- Component plug-in
- Smart Service plug-in
- Function plug-in

Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to select where a customer is located and store the selected address in Appian.

Select a match:

- Web-content field
- Component plug-in
- Smart Service plug-in
- Function plug-in

Generate a barcode image file based on values entered by users.

Select a match:

- Web-content field
- Component plug-in
- Smart Service plug-in
- Function plug-in

**Answer:**

**Explanation:**

Read barcode values from images containing barcodes and QR codes.

Select a match:

Web-content field

Component plug-in

Smart Service plug-in

Function plug-in

Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to see where a customer (stored within Appian) is located.

Select a match:

Web-content field

Component plug-in

Smart Service plug-in

Function plug-in

Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to select where a customer is located and store the selected address in Appian.

Select a match:

Web-content field

Component plug-in

Smart Service plug-in

Function plug-in

Generate a barcode image file based on values entered by users.

Select a match:

Web-content field

Component plug-in

Smart Service plug-in

Function plug-in

**Explanation:**

\* Read barcode values from images containing barcodes and QR codes. # Smart Service plug-in

\* Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to see where a customer (stored within Appian) is located. # Web-content field

\* Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to select where a customer is located and store the selected address in Appian. # Component plug-in

\* Generate a barcode image file based on values entered by users. # Function plug-in

**Explanation:** Appian plug-ins extend functionality by integrating custom Java code into the platform. The four approaches—Web-content field, Component plug-in, Smart Service plug-in, and Function plug-in—serve distinct purposes, and each requirement must be matched to the most appropriate one based on its use case. Appian's Plug-in Development Guide provides the framework for these decisions.

\* Read barcode values from images containing barcodes and QR codes # Smart Service plug-in:

This requirement involves processing image data to extract barcode or QR code values, a task that typically occurs within a process model (e.g., as part of a workflow). A Smart Service plug-in is ideal because it allows custom Java logic to be executed as a node in a process, enabling the decoding of images and returning the extracted values to Appian. This approach integrates seamlessly with Appian's process automation, making it the best fit for data extraction tasks.

\* Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to see where a customer (stored within Appian) is located # Web-content field:

This requires embedding an external mapping interface (e.g., Google Maps) within an Appian interface.

A Web-content field is the appropriate choice, as it allows you to embed HTML, JavaScript, or iframe content from an external source directly into an Appian form or report. This approach is lightweight and does not require custom Java development, aligning with Appian's recommendation for displaying external content without interactive data storage.

\* Display an externally hosted geolocation/mapping application's interface within Appian to allow users of Appian to select where a customer is located and store the selected address in Appian # Component plug-in: This extends the previous requirement by adding interactivity (selecting an address) and data storage. A Component plug-in is suitable because it enables the creation of a custom interface component (e.g., a map selector) that can be embedded in Appian interfaces. The plug-in can handle user interactions, communicate with the external mapping service, and update Appian data stores, offering a robust solution for interactive external

integrations.

\* Generate a barcode image file based on values entered by users # Function plug-in: This involves generating an image file dynamically based on user input, a task that can be executed within an expression or interface. A Function plug-in is the best match, as it allows custom Java logic to be called as an expression function (e.g., `pluginGenerateBarcode(value)`), returning the generated image. This approach is efficient for single-purpose operations and integrates well with Appian's expression-based design.

Matching Rationale:

\* Each approach is used once, as specified, covering the spectrum of plug-in types: Smart Service for process-level tasks, Web-content field for static external display, Component plug-in for interactive components, and Function plug-in for expression-level operations.

\* Appian's plug-in framework discourages overlap (e.g., using a Smart Service for display or a Component for process tasks), ensuring the selected matches align with intended use cases.

## NEW QUESTION # 27

.....

After your purchase of ACD301 learning engine, our system will send a link to your email in 5 to 10 minutes. You can contact our staff anytime and anywhere during the learning process. The staff of ACD301 study materials is online 24 hours a day, seven days a week. Our staff is really serious and responsible. We just want to provide you with the best service. I hope you enjoy using ACD301 Exam Materials.

**PDF ACD301 Cram Exam:** <https://www.getvalidtest.com/ACD301-exam.html>

The simplified information contained in our Appian ACD301 training guide is easy to understand without any difficulties. The only way to get success in the Appian ACD301 exam is that you should obtain reliable preparatory materials, Appian Exam ACD301 Pass Guide. We also pass guarantee and money back guarantee, and if you fail to pass the exam, we will give you refund. Appian PDF ACD301 Cram Exam questions are tough, especially all these aspects on routing protocols, multiple IP addressing questions and enterprise networks.

Applying a Color Scheme, Thus informed of the ACD301 Exam Materials history and philosophy of Windows, you can become a more effective Windows programmer. The simplified information contained in our Appian ACD301 training guide is easy to understand without any difficulties.

## 2026 Exam ACD301 Pass Guide - Latest Appian PDF ACD301 Cram Exam: Appian Lead Developer

The only way to get success in the Appian ACD301 exam is that you should obtain reliable preparatory materials. We also pass guarantee and money back guarantee, and if you fail to pass the exam, we will give you refund.

Appian questions are tough, especially all these ACD301 aspects on routing protocols, multiple IP addressing questions and enterprise networks. We ensure that if you fail to pass your exam by using ACD301 exam materials of us, we will give you full refund, and no other questions will be asked.
