Reliable NCA-7.5 Exam Topics: Nutanix Certified Associate (NCA) 7.5 Exam

This age changes quickly, so we can't be passively, we should be actively to follow the age. When you choose to participate in NCA-7.5 exam, you are proved to be an active person who wants better development opportunities for yourself. Our ITPassLeader is willing to help those active people like you to achieve their goals. The most comprehensive and Latest NCA-7.5 Exam Materials provided by us can meet all your need to prepare for NCA-7.5 exam

Nutanix NCA-7.5 Exam Syllabus Topics:

Section	Objectives
Recognize Nutanix Solutions and Tools	- Recognize Nutanix Cloud Infrastructure (NCI) technologies, features, and use cases - Recognize Nutanix tools, features, and use cases - Recognize non-NCI Nutanix technologies, features, and use cases
Demonstrate and Understand Platform Health and Monitoring	- Review and interpret alerts and events - Leverage support functions - Review and interpret workload performance - Perform and interpret health checks
Describe Cluster Configuration and Maintenance	- Identify software maintenance tasks - Describe supported cluster configuration options - Identify hardware maintenance tasks
Describe Nutanix Platform Administration	- Identify virtual networking tasks - Describe licensing tasks - Describe virtual machine administration tasks - Discuss storage operations

Nutanix Certified Associate (NCA) 7.5 Exam Sample Questions (Q16-Q21):

NEW QUESTION # 16

What are two requirements to upgrade Nutanix Guest Tools on a VM? (Choose two.)

- A. DNS entry for the VM
- B. VM powered off
- C. Empty CD-ROM drive
- D. VM powered on

Answer: C,D

Explanation:

The VM must be powered on so that the Nutanix Guest Agent and the guest operating system can participate in the NGT installation or upgrade workflow. The NGT software runs inside the guest, so a powered-off VM cannot execute the installer, communicate status, or complete the upgrade operation.

An available IDE or SATA CD-ROM slot is also required because Prism mounts the Nutanix Guest Tools ISO to the VM during configuration, installation, or upgrade. If the VM's virtual CD-ROM is already occupied by another ISO, the NGT media cannot be attached through the expected workflow. Nutanix documentation therefore requires at least one empty supported CD-ROM device. After installation or reconfiguration, supported versions can automatically eject the mounted NGT media.

A DNS entry is not a universal prerequisite for upgrading NGT. Although functional name resolution may support broader management operations, the upgrade requirement is based on VM power state and the ability to mount the NGT ISO. Powering off the VM directly conflicts with the installation requirement. References:

NEW QUESTION # 17

Which statement best describes the requirement for migrating a vDisk between storage containers in Nutanix AOS?

- A. A vDisk can only be migrated if snapshots are deleted first.
- B. A vDisk can be migrated between storage containers while the VM is powered on.
- C. The VM must be powered off before migrating a vDisk between storage containers.
- D. A vDisk migration requires the cluster to be in maintenance mode.

Answer: B

Explanation:

AOS supports live vDisk migration between storage containers while the vDisk remains attached to a powered-on guest VM. The VM does not need to be shut down or deleted. This capability allows administrators to move individual vDisks or all eligible vDisks associated with a VM to a container providing different storage settings.

Storage-container properties can include replication factor, encryption, compression, deduplication, and erasure coding. Migrating a vDisk to another container is therefore a controlled method of changing the storage characteristics applied to that disk without interrupting the running workload.

The operation does not require cluster maintenance mode, and existing snapshots do not universally need to be deleted. However, important restrictions apply. Migration cannot proceed when an applicable Prism Central storage policy is configured for the associated VM. Protected VMs may also need to be removed from their protection domain or protection policy before migration. The target container must have sufficient free capacity, and operations such as cloning, resizing, or taking new snapshots may be blocked while migration is active.

The essential requirement tested is that the VM may remain powered on during the storage-container migration.

NEW QUESTION # 18

An administrator needs to quickly deploy multiple VMs with identical configurations in Prism Central.

What is the most efficient approach?

- A. Use categories
- B. Use templates
- C. Configure volume groups
- D. Create snapshots

Answer: B

Explanation:

A VM template provides a controlled master configuration from which administrators can deploy multiple standardized virtual machines. The template preserves the source VM's supported configuration, including its virtual hardware, operating-system disk, and other deployment properties. Prism Central also supports template versioning, allowing administrators to maintain and update the master image without manually rebuilding every new VM.

Snapshots preserve point-in-time VM data and are primarily intended for recovery, cloning, or data-protection workflows; they are not the principal mechanism for repeatedly provisioning standardized VMs. Categories attach metadata to entities for organization, policy assignment, governance, and automation, but they do not contain a deployable VM configuration. Volume groups provide block-storage resources that can be attached to one or more VMs and therefore do not satisfy the requirement for identical complete VM deployments.

Nutanix documentation describes a VM template as a golden image or master copy used to create VMs in Prism Central.

Consequently, deploying from a template minimizes configuration variance and administrative effort. Reference: Prism Central 7.5 - VM Template Management . NHCF alignment: VM lifecycle operations and standardized VM provisioning.

NEW QUESTION # 19

An administrator needs to attach a Volume Group to a Virtual Machine (VM).
When can the administrator complete this task?

- A. When creating a Storage Policy
- B. When creating the VM
- C. When migrating the VM
- **D. When modifying the VM**

Answer: D

Explanation:

A Volume Group is attached to an existing AHV VM through the VM-management or Volume Group modification workflow. The administrator selects the VM for modification, accesses the Volume Groups section, chooses an available Volume Group and completes the attachment. Therefore, option B describes the applicable lifecycle stage.

A Volume Group consists of one or more virtual disks that can be presented to a VM as SCSI block devices.

After attachment, the guest operating system discovers the disks and the administrator can initialize, partition and format them according to application requirements. A Volume Group can also be managed from the Prism Element Volume Group interface, where the Attach to a VM action selects an existing target VM.

A storage policy governs storage behavior and does not itself attach a Volume Group. Migration changes workload placement or location but is not the standard attachment workflow. The initial VM-creation workflow focuses on defining the VM's compute, network and ordinary virtual-disk configuration; attaching an existing Volume Group is handled as a modification after the VM entity exists.

NEW QUESTION # 20

Which tool tests how a Nutanix environment will behave under a simulated production load?

- **A. Nutanix X-Ray**
- B. Nutanix Foundation
- C. Nutanix Move
- D. Nutanix Collector

Answer: A

Explanation:

Nutanix X-Ray is an automated testing and benchmarking framework that runs repeatable scenarios against hyperconverged infrastructure targets. It uses realistic workload generators and controlled infrastructure events to evaluate performance, resilience, scalability, data integrity, and availability. Its scenarios can simulate conditions such as VM cloning, snapshots, migrations, node failures, node power-offs, and sustained storage workloads.

X-Ray is intended for evaluation and test environments rather than active production clusters. The resulting metrics and reports allow

architects and administrators to compare configurations and determine how an environment behaves under representative production-style demand and failure conditions.

Nutanix Move migrates workloads between supported platforms and does not benchmark infrastructure behavior. Nutanix Collector gathers environmental information for assessment and sizing activities but does not generate simulated application loads. Nutanix Foundation images nodes and deploys or configures clusters; it is not a performance-testing framework.

The requirement to test behavior under simulated load therefore maps directly to X-Ray's scenario-based testing model. References: Nutanix X-Ray FAQ and X-Ray 4.4 - Test Scenarios . NHCF alignment: identifying Nutanix assessment, deployment, migration, and testing tools.
