Cisco Certified Design Expert (CCDE) Written Exam Sample Questions (Q149-Q154):

NEW QUESTION # 149

An enterprise campus is adopting a network virtualization design solution with these requirements

- * It must include the ability to virtualize the data plane and control plane by using VLANs and VRFs
- * It must maintain end-to-end logical path transport separation across the network
- * resources available grouped at the access edge

Which two primary models can this network virtualization design be categorized? (Choose two)

- A. Session isolation
- B. Path isolation
- C. Services virtualization
- D. Group virtualization
- E. Edge isolation

Answer: B,C

NEW QUESTION # 150

Traditionally, infrastructure is not managed using code, but instead it is managed and provisioned manually, which can cause potential issues. On the other side, infrastructure as code brings several advantages. What is a benefit of infrastructure as code?

- A. configuration drift
- B. declarative pipelines
- C. agent monitoring
- D. repeatable deployments

Answer: D

Explanation:

Repeatable deployments is a key benefit of infrastructure as code (IaC). By defining infrastructure in code, deployments can be automated and consistently reproduced, ensuring that the same environment is created every time, eliminating human error and inconsistencies.

NEW QUESTION # 151

Company XYZ wants to secure the data plane of their network. Which two technologies can be included in the security design? (Choose two)

- A. BEEP
- B. CPPr
- C. IP Source Guard
- D. MPP
- E. DAI

Answer: C,E

NEW QUESTION # 152

What is the best approach to ensure both scalability and high availability for a cloud-based storage solution over the IP network?

- A. Deploying a Content Delivery Network (CDN) to cache and serve frequently accessed storage content.
- B. Utilizing a Storage Area Network (SAN) with redundant controllers and paths for storage access.
- C. Implementing Network Attached Storage (NAS) devices in a clustered configuration for load balancing.
- D. Using a RAID (Redundant Array of Independent Disks) setup to provide data redundancy and improve performance.

Answer: C

Explanation:

A clustered NAS solution provides scalability by allowing additional nodes to be added seamlessly and high availability through node redundancy and load balancing. This ensures continuous access to data while distributing workload efficiently over the IP network.

NEW QUESTION # 153

Refer to the exhibit.

Refer to the exhibit. A new high availability DB server cluster is installed in the network. These two servers require high bandwidth and low latency Layer 2 connectivity for database replication.

Which solution supports these requirements?

- A. Add two new links between SW1 and SW2 configured as REP segments 1 and 2 respectively
- B. Add two new links between SW1 and SW2 configured as REP segment 3
- C. Add secondary links to REP segments 1 and 2
- D. Add two new links between SW1 and SW2 configured as LACP trunk with STP

Answer: B

Explanation:

To support high-bandwidth, low-latency Layer 2 communication between DB Server 1 and DB Server 2, you must create a direct Layer 2 path between SW1 and SW2. Using REP (Resilient Ethernet Protocol) segments ensures loop-free Layer 2 operation without the drawbacks of STP convergence delays.

* Option C is correct: Adding a third REP segment (Segment 3) directly between SW1 and SW2 isolates the traffic between the two DB servers and ensures deterministic behavior with fast convergence.

* Option A (LACP with STP) introduces STP blocking and doesn't align well with REP's control plane.

* Option B and D: Overloading existing segments or splitting new links into existing REP segments does not offer the same direct path, bandwidth, or deterministic behavior.
