## ISTQB Certified Tester - Performance Testing Sample Questions (Q19-Q24):

### NEW QUESTION # 19

Which of the following is a general principle of performance testing?

- A. Tests must be executable within the project timeframe.
- B. Test results must be comparable to tester expectations.
- C. Tests must align with the ideal outcome of stakeholders.
- D. Test results must vary when the tests are run repeatedly on an unchanged system.

**Answer: A**

**Explanation:**

Performance testing is time-sensitive and must be designed to fit within the constraints of the project timeline. If performance tests take too long to execute, they may not be feasible within a given sprint or development cycle. The results should be reproducible, meaning the same test on an unchanged system should yield the same results (making option C incorrect). While stakeholder expectations are important, performance tests should be objective and based on defined benchmarks rather than subjective expectations (making option D incorrect).

### NEW QUESTION # 20

Which of the following is the most economical solution to minimize costs and time for performance testing for a high-end production client-server platform?

- A. Cloud-based environment
- B. Isolated lab environment
- C. Mainframe environment
- D. No environment

**Answer: A**

Explanation:

A cloud-based environment is the most cost-effective solution for performance testing. It offers scalability, pay-per-use models, and flexibility, allowing testers to simulate large workloads without expensive infrastructure investments.

Option A (Isolated lab environment) is costly due to hardware maintenance and infrastructure costs.

Option C (Mainframe environment) is expensive and impractical for performance testing.

Option D (No environment) is not a viable option.

### NEW QUESTION # 21

Which of the following could lead to inconsistent performance test results?

- A. Expected results were not verified with senior management.
- B. Concurrent scripts running and attempting to access the same data.
- C. Virtual users running the same script while logged in as the same user.
- D. Sequential scripts running and attempting to access the same data.

**Answer: C**

Explanation:

If multiple virtual users execute the same script while logged in as the same user, it can cause data conflicts, session collisions, or cache interference, leading to inconsistent performance test results.

Option A (Concurrent scripts accessing the same data) may cause data locking issues, but this is a test setup concern rather than an inconsistency issue.

Option B (Sequential scripts accessing the same data) does not typically cause inconsistencies since they execute in order.

Option D (Verification with management) is unrelated to technical inconsistencies.

### NEW QUESTION # 22

You are heading the testing effort for a system that manages the air/fuel ratio of direct-injection fuel devices built specifically for high-altitude rescue helicopter engines. At altitude, the system must be able to perform in order to make enough air/fuel ratio adjustments per millisecond between fuel and both an on-board source and available ambient air in order to prevent an engine stall due to oxygen starvation. The system is following a sequential development lifecycle.

For this safety-critical software, when is the appropriate point in the lifecycle to identify and define the performance goals?

- A. During the requirements phase when the business stakeholders have the opportunity to agree
- B. After test readiness has been achieved, but before system testing starts
- C. During the software design phase when the requirements are set and the design is being defined
- D. At the very beginning of the project during the concept stage

**Answer: A**

Explanation:

For safety-critical software, performance goals must be identified as early as the requirements phase. This ensures that performance constraints are well understood and accounted for throughout development.

Option A (After test readiness but before system testing) is too late, as requirements should be defined before coding begins.

Option C (During the concept stage) is too early, as details may not be concrete.

Option D (During software design) is useful but should be preceded by a proper definition during the requirements phase.

### NEW QUESTION # 23

At what point during performance testing does monitoring with the load testing tool begin?

- A. Immediately after test execution.
- B. Before testing execution.
- **C. Simultaneously with test execution.**
- D. When testing is concluded.

**Answer: C**

Explanation:

Performance monitoring must begin simultaneously with test execution to capture system behavior in real-time. This ensures that bottlenecks and performance issues are identified immediately.

Option A (After testing is concluded) is incorrect because historical monitoring does not help in real-time analysis.

Option B (Before execution) is incorrect because monitoring needs active system load to measure performance.

Option C (Immediately after execution) is incorrect because it misses runtime metrics.
