Default Gateway Migration Considerations

The default gateway used by the workloads to establish communication outside their IP subnet is initially maintained in the Brownfield network; this implies that the ACI fabric initially provides only Layer 2 services for devices part of EPG1, and the workloads already migrated to the ACI fabric send traffic to the Brownfield network when they need to communicate with devices external to their IP subnet (shown in the following diagram).

The screenshot displays the Cisco ACI configuration interface for a Bridge Domain. The left sidebar shows a tree view of the configuration hierarchy, with 'Bridge Domains (63)' expanded to show 'TnT-14AP10AppBD'. The main panel shows the 'PROPERTIES' for this Bridge Domain. The configuration includes the following fields and values:

- Name: TnT-14AP10AppBD

- Private Network: TnT-14/TnT-14NET
