The reality is often cruel. What do we take to compete with other people? More useful certifications like ARA-C01 certificate? In this era of surging talent, why should we stand out among the tens of thousands of graduates and be hired by the company? Perhaps the few qualifications you have on your hands are your greatest asset, and the ARA-C01 Test Prep is to give you that capital by passing exam fast and obtain certification soon. Don't doubt about it. More useful certifications mean more ways out. If you pass the ARA-C01 exam, you will be welcome by all companies which have relating business with ARA-C01 exam torrent.

Obtaining the Snowflake ARA-C01 certification demonstrates that an individual has the skills and expertise to design, implement, and manage complex data solutions on the Snowflake platform. SnowPro Advanced Architect Certification certification is highly valued in the IT industry and can lead to better job opportunities and higher salaries. Additionally, Snowflake ARA-C01 Certified professionals can help their organizations to optimize their data solutions and achieve better business outcomes.

Pass Guaranteed Quiz 2026 Efficient Snowflake ARA-C01 Dumps Reviews

Elaborately designed and developed ARA-C01 test guide as well as good learning support services are the key to assisting our customers to realize their dreams. Our ARA-C01 study braindumps have a variety of self-learning and self-assessment functions to detect learners' study outcomes, and the statistical reporting function of our ARA-C01 test guide is designed for students to figure out their weaknesses and tackle the causes, thus seeking out specific methods dealing with them. Our ARA-C01 exam guide have also set a series of explanation about the complicated parts certificated by the syllabus and are based on the actual situation to stimulate exam circumstance in order to provide you a high-quality and high-efficiency user experience. In addition, the ARA-C01 Exam Guide function as a time-counter, and you can set fixed time to fulfill your task, so that promote your efficiency in real test. The key strong-point of our ARA-C01 test guide is that we impart more important knowledge with fewer questions and answers, with those easily understandable ARA-C01 study braindumps, you will find more interests in them and experience an easy learning process.

To take the Snowflake ARA-C01 Certification Exam, candidates must have already achieved the SnowPro Core Certification, which validates their foundational knowledge of Snowflake. The ARA-C01 exam is designed to test the candidate's ability to apply their knowledge to real-world scenarios and solve complex problems related to Snowflake architecture and implementation. ARA-C01 exam consists of multiple-choice questions, scenario-based questions, and hands-on exercises that test the candidate's practical skills.

Earning the Snowflake ARA-C01: SnowPro Advanced Architect Certification demonstrates a high level of expertise and proficiency in designing and implementing complex data solutions using Snowflake's cloud data platform. It signifies that the candidate has the skills and knowledge required to deliver successful Snowflake solutions that meet the highest standards of performance, security, and scalability. It is a valuable credential for professionals who want to advance their careers in the field of data analytics and cloud computing.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q88-Q93):

NEW QUESTION # 88

An Architect uses COPY INTO with the ON_ERROR=SKIP_FILE option to bulk load CSV files into a table called TABLEA, using its table stage. One file named file5.csv fails to load. The Architect fixes the file and re-loads it to the stage with the exact same file name it had previously.

Which commands should the Architect use to load only file5.csv file from the stage? (Choose two.)

- A. COPY INTO tablea FROM @%tablea MERGE = TRUE;
- B. COPY INTO tablea FROM @%tablea FILES = ('file5.csv');
- C. COPY INTO tablea FROM @%tablea RETURN_FAILED_ONLY = TRUE;
- D. COPY INTO tablea FROM @%tablea;
- E. COPY INTO tablea FROM @%tablea NEW_FILES_ONLY = TRUE;
- F. COPY INTO tablea FROM @%tablea FORCE = TRUE;

Answer: B,D

Explanation:

* Option A (RETURN_FAILED_ONLY) will only load files that previously failed to load. Since file5.csv

already exists in the stage with the same name, it will not be considered a new file and will not be loaded.

* Option D (FORCE) will overwrite any existing data in the table. This is not desired as we only want to load the data from file5.csv.

* Option E (NEW_FILES_ONLY) will only load files that have been added to the stage since the last COPY command. This will not work because file5.csv was already in the stage before it was fixed.

* Option F (MERGE) is used to merge data from a stage into an existing table, creating new rows for any data not already present. This is not needed in this case as we simply want to load the data from file5.csv.

Therefore, the architect can use either COPY INTO tablea FROM @%tablea or COPY INTO tablea FROM @%tablea FILES = ('file5.csv') to load only file5.csv from the stage. Both options will load the data from the specified file without overwriting any existing data or requiring additional configuration

NEW QUESTION # 89

Which organization-related tasks can be performed by the ORGADMIN role? (Choose three.)

- A. Deleting an account
- B. Viewing a list of organization accounts
- C. Changing the name of the organization
- D. Enabling the replication of a database
- E. Changing the name of an account
- F. Creating an account

Answer: B,D,F

Explanation:

According to the SnowPro Advanced: Architect documents and learning resources, the organization-related tasks that can be performed by the ORGADMIN role are:

* Creating an account in the organization. A user with the ORGADMIN role can use the CREATE ACCOUNT command to create

a new account that belongs to the same organization as the current account¹.

* Viewing a list of organization accounts. A user with the ORGADMIN role can use the SHOW ORGANIZATION ACCOUNTS command to view the names and properties of all accounts in the organization². Alternatively, the user can use the Admin Accounts page in the web interface to view the organization name and account names³.

* Enabling the replication of a database. A user with the ORGADMIN role can use the SYSTEM\$GLOBAL_ACCOUNT_SET_PARAMETER function to enable database replication for an account in the organization. This allows the user to replicate databases across accounts in different regions and cloud platforms for data availability and durability⁴.

The other options are incorrect because they are not organization-related tasks that can be performed by the ORGADMIN role. Option A is incorrect because changing the name of the organization is not a task that can be performed by the ORGADMIN role. To change the name of an organization, the user must contact Snowflake Support³. Option D is incorrect because changing the name of an account is not a task that can be performed by the ORGADMIN role. To change the name of an account, the user must contact Snowflake Support⁵. Option E is incorrect because deleting an account is not a task that can be performed by the ORGADMIN role. To delete an account, the user must contact Snowflake Support. NEW QUESTION # 90

Is it possible for a data provider account with a Snowflake Business Critical edition to share data with an Enterprise edition data consumer account?

- A. If a user in the provider account with a share owning role sets share_restrictions to False when adding an Enterprise consumer account, it can import the share.
- B. If a user in the provider account with role authority to create or alter share adds an Enterprise account as a consumer, it can import the share.
- C. If a user in the provider account with a share owning role which also has override share restrictions privilege share_restrictions set to False when adding an Enterprise consumer account, it can import the share.
- D. A Business Critical account cannot be a data sharing provider to an Enterprise consumer. Any consumer accounts must also be Business Critical.

Answer: C

Explanation:

Data sharing is a feature that allows Snowflake accounts to share data with each other without the need for data movement or copying¹. Data sharing is enabled by creating shares, which are collections of database objects (tables, views, secure views, and secure UDFs) that can be accessed by other accounts, called consumers².

By default, Snowflake does not allow sharing data from a Business Critical edition account to a non-Business Critical edition account. This is because Business Critical edition offers higher levels of data protection and encryption than other editions, and sharing data with lower editions may compromise the security and compliance of the data³.

However, Snowflake provides the OVERRIDE SHARE RESTRICTIONS global privilege, which allows a user to override the default restriction and share data from a Business Critical edition account to a non-Business Critical edition account. This privilege is granted to the ACCOUNTADMIN role by default, and can be granted to other roles as well⁴.

To enable data sharing from a Business Critical edition account to an Enterprise edition account, the following steps are required^{3,4}:

A user in the provider account with the OVERRIDE SHARE RESTRICTIONS privilege must create or alter a share and add the Enterprise edition account as a consumer. The user must also set the share_restrictions parameter to False when adding the consumer. This parameter indicates whether the share is restricted to Business Critical edition accounts only. Setting it to False allows the share to be imported by lower edition accounts.

A user in the consumer account with the IMPORT SHARE privilege must import the share and grant access to the share objects to other roles in the account. The user must also set the share_restrictions parameter to False when importing the share. This parameter indicates whether the consumer account accepts shares from Business Critical edition accounts only. Setting it to False allows the consumer account to import shares from lower edition accounts.

NEW QUESTION # 91

A retail company has over 3000 stores all using the same Point of Sale (POS) system. The company wants to deliver near real-time sales results to category managers. The stores operate in a variety of time zones and exhibit a dynamic range of transactions each minute, with some stores having higher sales volumes than others.

Sales results are provided in a uniform fashion using data engineered fields that will be calculated in a complex data pipeline.

Calculations include exceptions, aggregations, and scoring using external functions interfaced to scoring algorithms. The source data for aggregations has over 100M rows.

Every minute, the POS sends all sales transactions files to a cloud storage location with a naming convention that includes store numbers and timestamps to identify the set of transactions contained in the files. The files are typically less than 10MB in size.

How can the near real-time results be provided to the category managers? (Select TWO).

- A. A Snowpipe should be created and configured with `AUTO_INGEST = true`. A stream should be created to process `INSERTS` into a single target table using the stream metadata to inform the store number and timestamps.
- B. A stream should be created to accumulate the near real-time data and a task should be created that runs at a frequency that matches the real-time analytics needs.
- C. All files should be concatenated before ingestion into Snowflake to avoid micro-ingestion.
- D. The copy into command with a task scheduled to run every second should be used to achieve the near-real time requirement.
- E. An external scheduler should examine the contents of the cloud storage location and issue SnowSQL commands to process the data at a frequency that matches the real-time analytics needs.

Answer: A,B

Explanation:

To provide near real-time sales results to category managers, the Architect can use the following steps:

* Create an external stage that references the cloud storage location where the POS sends the sales transactions files. The external stage should use the file format and encryption settings that match the source files²

* Create a Snowpipe that loads the files from the external stage into a target table in Snowflake. The Snowpipe should be configured with `AUTO_INGEST = true`, which means that it will automatically detect and ingest new files as they arrive in the external stage.

The Snowpipe should also use a copy option to purge the files from the external stage after loading, to avoid duplicate ingestion³

* Create a stream on the target table that captures the `INSERTS` made by the Snowpipe. The stream should include the metadata columns that provide information about the file name, path, size, and last modified time. The stream should also have a retention period that matches the real-time analytics needs⁴

* Create a task that runs a query on the stream to process the near real-time data. The query should use the stream metadata to extract the store number and timestamps from the file name and path, and perform the calculations for exceptions, aggregations, and scoring using external functions. The query should also output the results to another table or view that can be accessed by the category managers. The task should be scheduled to run at a frequency that matches the real-time analytics needs, such as every minute or every 5 minutes.

The other options are not optimal or feasible for providing near real-time results:

* All files should be concatenated before ingestion into Snowflake to avoid micro-ingestion. This option is not recommended because it would introduce additional latency and complexity in the data pipeline.

Concatenating files would require an external process or service that monitors the cloud storage location and performs the file merging operation. This would delay the ingestion of new files into Snowflake and increase the risk of data loss or corruption.

Moreover, concatenating files would not avoid micro-ingestion, as Snowpipe would still ingest each concatenated file as a separate load.

* An external scheduler should examine the contents of the cloud storage location and issue SnowSQL commands to process the data at a frequency that matches the real-time analytics needs. This option is not necessary because Snowpipe can automatically ingest new files from the external stage without requiring an external trigger or scheduler. Using an external scheduler would add more overhead and dependency to the data pipeline, and it would not guarantee near real-time ingestion, as it would depend on the polling interval and the availability of the external scheduler.

* The copy into command with a task scheduled to run every second should be used to achieve the near-real time requirement. This option is not feasible because tasks cannot be scheduled to run every second in Snowflake. The minimum interval for tasks is one minute, and even that is not guaranteed, as tasks are subject to scheduling delays and concurrency limits. Moreover, using the copy into command with a task would not leverage the benefits of Snowpipe, such as automatic file detection, load balancing, and micro-partition optimization. References:

NEW QUESTION # 92

What is a valid object hierarchy when building a Snowflake environment?

- A. Account --> Database --> Schema --> Warehouse
- B. Account --> Schema > Table --> Stage
- C. Organization --> Account --> Stage --> Table --> View
- D. Organization --> Account --> Database --> Schema --> Stage

Answer: D
