### NEW QUESTION # 269

In a multi-container Docker environment in AWS Elastic Beanstalk, what is required to configure container instances in the environment?

- A. A Docker in an application package
- B. A CLI for Elastic Beanstalk
- C. An Amazon ECS task definition
- **D. An Amazon ECS cluster**

**Answer: D**

### NEW QUESTION # 270

An online food company provides an Amazon API Gateway HTTP API to receive orders for partners. The API is integrated with an AWS Lambda function. The Lambda function stores the orders in an Amazon DynamoDB table.

The company expects to onboard additional partners. Some partners require additional Lambda function to receive orders.

The company has created an Amazon S3 bucket. The company needs to store all orders and updates in the S3 bucket for future analysis. How can the developer ensure that orders and updates are stored to Amazon S3 with the LEAST development effort?

- A. Create a new Lambda function and a new API Gateway API endpoint. Configure the new Lambda function to write to the S3 bucket. Modify the original Lambda function to post updates to the new API endpoint.
- B. Modify the Lambda function to publish to a new Amazon SNS topic. Create a new Lambda function to receive orders. Subscribe a new Lambda function to the topic. Configure the new Lambda function to write to the S3 bucket as updates come through the topic.
- C. Use Amazon Kinesis Data Streams to create a new data stream. Modify the Lambda function to publish orders to the data stream. Configure the data stream to write to the S3 bucket.
- **D. Enable DynamoDB Streams on the DynamoDB table. Create a new Lambda function. Associate the stream's Amazon Resource Name (ARN) with the Lambda function. Configure the Lambda function to write to the S3 bucket as records appear in the table's stream.**

**Answer: D**

Explanation:

This solution will ensure that all orders and updates are stored to Amazon S3 with the least development effort because it uses DynamoDB Streams to capture changes in the DynamoDB table and trigger a Lambda function to write those changes to the S3 bucket. This way, the original Lambda function and API Gateway API endpoint do not need to be modified, and no additional services are required. Option A is not optimal because it will require more development effort to create a new Lambda function and a new API Gateway API endpoint, and to modify the original Lambda function to post updates to the new API endpoint. Option B is not optimal because it will introduce additional costs and complexity to use Amazon SNS to create a new data stream, and to modify the Lambda function to publish orders to the data stream. Option D is not optimal because it will require more development effort to modify the Lambda function to publish to a new Amazon SNS topic, and to create and subscribe a new Lambda function to the topic.

- **B. Deploy the website code in an AWS Elastic Beanstalk environment. Use Auto Scaling to scale the number of instances.**

- C. Use Amazon S3 to host the website. Use Amazon CloudFront to deliver the content at scale.
- D. Launch multiple Amazon Lightsail instance behind a load balancer. Set up the website on those instances.

**Answer: B**

#### NEW QUESTION # 272

Given the following AWS CloudFormation template:

What is the MOST efficient way to reference the new Amazon S3 bucket from another AWS CloudFormation template?

- A. Add Exported: True to the ContentBucket in the original template and use ImportResource in other templates.
- **B. Use Fn::Include to include the existing template in other template and use the ContentBucket resource directly**
- C. Create a custom AWS CloudFormation resource that gets the bucket name from the ContentBucket resource of the first stack.
- D. Add an Export declaration to the outputs section of the original template and use ImportValue in other templates.

**Answer: B**
