

Quiz Fantastic Salesforce - Analytics-Admn-201 - Salesforce Certified Tableau Server Administrator Exam PDF

2026 Latest TestkingPDF Analytics-Admn-201 PDF Dumps and Analytics-Admn-201 Exam Engine Free Share:
<https://drive.google.com/open?id=1R5RZ6f8xrCafvEz2bs-CSl8-p7bVeNuR>

There are great and plenty benefits after the clients pass the Analytics-Admn-201 test. Because the knowledge that our Analytics-Admn-201 exam practice materials provides is conducive to enhancing the client's practical working abilities and stocks of knowledge, the clients will be easier to increase their wages and be promoted by their boss. Besides, they will be respected by their colleagues, friends and family members and be recognized as the elites among the industry. They will acquire more access to work abroad for further studies. So the clients must appreciate our Analytics-Admn-201 study question after they pass the test.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 2	<ul style="list-style-type: none">• Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 3	<ul style="list-style-type: none">• Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.
Topic 4	<ul style="list-style-type: none">• Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.

Topic 5	<ul style="list-style-type: none"> Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.

Test Analytics-Admn-201 Guide & Analytics-Admn-201 Dumps Torrent

Passing the Analytics-Admn-201 is the primary concern. To pass the hard Analytics-Admn-201 exam on the first try, you must invest more time, effort, and money. To pass the Analytics-Admn-201 Exam, you must have the right Analytics-Admn-201 Exam Dumps, which are quite hard to get online. Salesforce provides latest Analytics-Admn-201 free study questions, it is true and effective, and price is affordable.

Salesforce Certified Tableau Server Administrator Sample Questions (Q19-Q24):

NEW QUESTION # 19

A user receives an error after attempting to run an extract refresh on the Tableau Server. What should you review to identify the cause of the problem?

- A. The UNC path to the extract's data source
- B. The status of the Backgrounder process, as shown by the `tsm status -v` command
- C. Whether the project permissions are set to Locked to the project
- D. [The Background Tasks for Extracts administrative view on the site status page](#)

Answer: D

Explanation:

When an extract refresh fails on Tableau Server, troubleshooting requires identifying the root cause-e.g., connectivity issues, resource constraints, or configuration errors. The Backgrounder process handles extract refreshes, so it's a key focus, but the best diagnostic tool depends on granularity and context. Let's explore this thoroughly:

* Extract Refresh Process:

* An extract refresh pulls data from a source (e.g., database, file) into a .hyper file stored on Tableau Server.

* The Backgrounder executes these tasks based on schedules or manual triggers.

* Errors could stem from: database connectivity, credentials, file access, resource overload, or task misconfiguration.

* Option B (Background Tasks for Extracts administrative view): Correct. This is the most direct and detailed method:

* Location: In the Tableau Server web UI, go to Server > Status > Background Tasks for Extracts (or site-specific under Site > Status).

* Details Provided:

* Task name, schedule, and workbook/data source.

* Start/end times and status (e.g., Failed, Success).

* Error messages (e.g., "Cannot connect to database," "Permission denied").

* Why It's Best: It pinpoints the exact failure (e.g., "timeout," "invalid credentials") for the specific refresh, offering actionable insights without needing to dig through logs manually. Server or site administrators can access this view to diagnose issues quickly.

* Example: If the error is "Database login failed," you'd check credentials in the data source settings next.

* Option A (Status of the Backgrounder process via `tsm status -v`): Partially useful but insufficient:

* What It Shows: Running/stopped status of all processes (e.g., "Backgrounder: RUNNING").

* Limitation: It confirms if Backgrounder is operational but doesn't reveal why a specific task failed-no error details or task-level granularity.

* Use Case: If Backgrounder is stopped or crashed, this might indicate a broader issue, but the question implies a single refresh error, not a server-wide failure.

* Option C (The UNC path to the extract's data source): Relevant but secondary:

* Context: If the data source is a file (e.g., CSV on a network share), the UNC path (e.g.,

\\server\share\file.csv) must be accessible.

* Why Not First: The error could be unrelated (e.g., database issue, not file-based). The admin view (B) would reveal if it's a path issue first, guiding you to check the UNC path only if indicated (e.g., "File not found").

* Practical Note: Backgrounder needs share permissions and the Run As account must access it- checking this without context wastes time.

* Option D (Whether project permissions are set to Locked): Unlikely cause:

* Permissions Impact: Locked permissions restrict who can edit/view content, not whether an extract refresh runs-that's tied to the data source's connection settings and Backgrounder execution.

* Exception: If the refresh user lacks "Connect" permission to the data source, it might fail, but this is rare (owner/schedule typically has access). The admin view would flag this.

Why This Matters: The Background Tasks view is Tableau's purpose-built tool for extract diagnostics, saving time and reducing guesswork in production environments.

Reference: Tableau Server Documentation - "Administrative Views: Background Tasks for Extracts" (https://help.tableau.com/current/server/en-us/adminview_background_tasks.htm).

NEW QUESTION # 20

What type of information is stored in the tsm maintenance backup -f <filename>.tsbak command?

- A. Topology data
- **B. Repository data**
- C. SMTP server settings
- D. Notification settings

Answer: B

Explanation:

The tsm maintenance backup command creates a backup file (with a .tsbak extension) that captures critical data needed to restore Tableau Server in case of failure or migration. This backup primarily includes:

Repository data: This encompasses the PostgreSQL database, which stores metadata such as workbooks, data sources, user information, permissions, schedules, and subscriptions.

Configuration data: This includes server settings like authentication methods, port configurations, and service layouts, but it does not include topology data as a separate entity (topology is part of the configuration).

The command does not back up the following:

Extract files (stored in the File Store), which must be backed up separately if needed.

Log files, which are archived using tsm maintenance ziplogs.

Option A (Notification settings) is incorrect because while notification settings are part of the configuration data stored in the repository, they are not the primary focus of the backup. The broader category is "repository data." Option B (SMTP server settings) is also incorrect for the same reason-SMTP settings are configuration data within the repository, but the backup is not limited to just these settings.

Option D (Topology data) is incorrect because topology data (e.g., how services are distributed across nodes) is part of the configuration included in the backup, but it's not stored as a standalone item. The .tsbak file is centered on the repository database.

Reference: Tableau Server Documentation - "Back Up Tableau Server Data" (https://help.tableau.com/current/server/en-us/backup_restore.htm).

NEW QUESTION # 21

What should you do to configure the view URL and enable recording for a site that has recording workbook performance metrics enabled?

- A. Click the Performance link in the toolbar at the top of the view
- B. Delete the session ID in the URL and reload the view
- C. Type :record_performance=yes& at the end of the view URL, immediately before the session ID
- **D. Type :record_performance=yes& at the end of the view URL, immediately after the session ID**

Answer: D

Explanation:

Tableau Server can record performance metrics for workbooks to troubleshoot slow-loading views. This feature must be enabled at the site level (via Settings > General > Allow Performance Recording). Once enabled, you can trigger recording for a specific view by modifying its URL.

The correct syntax is to append `:record_performance=yes&` to the view URL, immediately after the session ID. For example:

* Original

URL: `http://server/##/site/my-site/views/workbook/view?iid=1`

* Modified

URL: `http://server/##/site/my-site/views/workbook/view?iid=1:record_performance=yes&`

After loading the view with this parameter, a performance recording is generated and accessible via the Performance option in the toolbar.

* Option B (Type `:record_performance=yes&` at the end of the view URL, immediately after the session ID): Correct. This follows Tableau's documented method for enabling performance recording.

* Option A (Click the Performance link in the toolbar): Incorrect. The Performance link appears only after recording is triggered via the URL; it's not the method to enable it.

* Option C (Type `:record_performance=yes&` immediately before the session ID): Incorrect. The parameter must follow the session ID (e.g., `iid=1`) to function correctly.

* Option D (Delete the session ID in the URL and reload the view): Incorrect. The session ID is required for the view to load properly; removing it breaks the URL.

Reference: Tableau Server Documentation - "Record Performance of a View" (https://help.tableau.com/current/server/en-us/perf_record.htm).

NEW QUESTION # 22

Which Tableau Server process performs the role of a database for metadata?

- A. File Store
- **B. Repository**
- C. Data Engine
- D. Backgrounder

Answer: B

Explanation:

Tableau Server relies on several processes to function, each with a specific role. The Repository process (powered by PostgreSQL) serves as the database for metadata, storing critical information such as:

* User and group details.

* Permissions and site configurations.

* Workbook and data source metadata (e.g., schedules, subscriptions).

* Option B (Repository): Correct. The Repository is the centralized database that holds all metadata, making it the backbone of Tableau Server's content management. There are typically two instances in an HA setup (one active, one passive), monitored by the Cluster Controller.

* Option A (Data Engine): Incorrect. The Data Engine manages in-memory data processing and extract storage (e.g., .hyper files), not metadata. It's separate from the Repository.

* Option C (Backgrounder): Incorrect. The Backgrounder handles background tasks like extract refreshes and subscriptions, but it doesn't store metadata—it interacts with the Repository to retrieve task details.

* Option D (File Store): Incorrect. The File Store manages physical extract files and workbook assets, not metadata, which is stored in the Repository.

Reference: Tableau Server Documentation - "Tableau Server Processes" (<https://help.tableau.com/current/server/en-us/processes.htm>).

NEW QUESTION # 23

What two events must occur for Tableau Server to recompute queries for a workbook cache after a scheduled refresh? (Choose two.)

- A. The workbook was published in the last month
- **B. The workbook has upcoming scheduled refresh tasks**
- **C. The workbook has been viewed recently**
- D. The All Users group has a permission rule allowing access to the workbook

Answer: B,C

Explanation:

Tableau Server uses caching to speed up workbook loading by storing query results. After a scheduled extract refresh updates the data, the cache may need recomputing-let's dive into the mechanics:

* Caching Basics:

* VizQL Cache: Stores rendered views and query results for faster access.

* Refresh Trigger: A scheduled refresh updates the underlying extract (.hyper), but the cache isn't automatically invalidated-it's demand-driven.

* Recompute Conditions: Tableau recomputes the cache when the workbook is accessed (viewed) and its data has changed (e.g., via refresh).

* Evaluation:

* Option B (The workbook has upcoming scheduled refresh tasks): Correct.

* Why: An upcoming refresh task indicates the workbook relies on an extract with a schedule. After the refresh runs, the data changes, priming the cache for recomputation on next view. Without a schedule, no refresh occurs, so this is a prerequisite.

* Detail: Schedules are set in Schedules > Tasks-e.g., "Daily at 2 AM."

* Option D (The workbook has been viewed recently): Correct.

* Why: Viewing triggers cache recomputation if the data has changed (e.g., post-refresh).

Tableau uses a "lazy caching" model-cache updates only when a user loads the workbook, ensuring fresh results.

* Detail: "Recently" isn't strictly defined but implies post-refresh access.

* Option A (Published in the last month): Incorrect.

* Why: Publish date is irrelevant-cache recomputation ties to data changes and access, not publication timing.

* Option C (All Users group has permission rule allowing access): Incorrect.

* Why: Permissions enable viewing, but recomputation requires actual access (viewing) and a refresh event, not just potential access.

Why This Matters: Caching balances performance and freshness-understanding triggers prevents stale data surprises.

Reference: Tableau Server Documentation - "Caching and Performance" (https://help.tableau.com/current/server/en-us/perf_cache.htm).

NEW QUESTION # 24

.....

Our Analytics-Admn-201 learning questions engage our working staff in understanding customers' diverse and evolving expectations and incorporate that understanding into our strategies, thus you can 100% trust our Analytics-Admn-201 exam engine. And our professional Analytics-Admn-201 Study Materials determine the high pass rate. According to the research statistics, we can confidently tell that 99% candidates after using our products have passed the Analytics-Admn-201 exam.
