

# Microsoft AB-731 Exam PDF Dumps And Practice Test Software Is Ready For Download

BONUS!!! Download part of DumpsQuestion AB-731 dumps for free: <https://drive.google.com/open?id=1bCoeDK4w8eLgqxa8crdZaqlYqZUR91Ij>

Although a lot of products are cheap, but the quality is poor, perhaps users have the same concern for our latest AB-731 exam preparation materials. Here, we solemnly promise to users that our AB-731 exam questions error rate is zero. Everything that appears in our products has been inspected by experts. In our AB-731 practice materials, users will not even find a small error, such as spelling errors or grammatical errors. It is believed that no one is willing to buy defective products, so, the AB-731 study guide has established a strict quality control system.

## Microsoft AB-731 Exam Overview:

|                                |                                                                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Certification Vendor:</b>   | Microsoft                                                                                                   |
| <b>Exam Name:</b>              | AI Transformation Leader                                                                                    |
| <b>Exam Number:</b>            | AB-731                                                                                                      |
| <b>Exam Duration:</b>          | 45 minutes                                                                                                  |
| <b>Exam Format:</b>            | Interactive components (may be included), Multiple-choice / scenario-based questions, Proctored online exam |
| <b>Passing Score:</b>          | 700                                                                                                         |
| <b>Exam Price:</b>             | \$99 USD                                                                                                    |
| <b>Available Languages:</b>    | English                                                                                                     |

**Microsoft AI Transformation Leader Sample Questions (Q66-Q71):****NEW QUESTION # 66**

Your company has an AI solution that uses a prebuilt Azure OpenAI model to generate content. You need to reduce the cost of the solution while minimizing the impact on the quality of the generated output. Which two actions should you perform? (Select TWO.)

NOTE: Each correct selection is worth one point.

- A. Switch to an alternate model.
- B. Optimize the prompts.
- C. Fine-tune the existing model.
- D. Apply content moderation.
- E. Decrease the number of hosting hours for the model.

**Answer: A,B**

Explanation:

To reduce Azure OpenAI costs with minimal quality loss, you target the biggest cost drivers: token usage and model price per token (or throughput unit). C (Optimize the prompts) is a best practice because shorter, clearer prompts reduce unnecessary input tokens and often reduce output length by tightening instructions and formatting. Prompt optimization can preserve or even improve quality by removing ambiguity, adding constraints, and using compact context (for example, only the most relevant grounding passages). Lower token consumption directly lowers cost while maintaining response usefulness.

D (Switch to an alternate model) is also effective because different models have different price/performance tradeoffs. Moving from a premium model to a more cost-efficient model (or a smaller variant) can significantly reduce spend. You can minimize quality impact by validating outputs on representative scenarios and using a tiered approach (cheap model by default, expensive model only for complex cases).

The other options are less aligned to the goal. A (Fine-tune) typically increases cost (training and ongoing evaluation) and is not the first-line cost reducer. B (Content moderation) is primarily a safety control; it can add overhead and doesn't directly reduce token costs. E (Decrease hosting hours) applies to capacity-based hosting scenarios, but the question states a prebuilt Azure OpenAI model for content generation-cost reduction is best achieved by prompt/token optimization and selecting the right model.

### NEW QUESTION # 67

#### Hotspot Question

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

#### Statements

Content filtering controls can prevent AI-generated responses from exposing confidential and sensitive information.

Yes

☐

No

☐

AI-generated content can unintentionally reveal sensitive information if the generative AI model has access to unsecured data sources.

☐☐

To prevent data exposure, only the prompts used by users must be protected by using policies.

☐☐

Answer:

Explanation:

Answer Area

#### Statements

Content filtering controls can prevent AI-generated responses from exposing confidential and sensitive information.

Yes

☒

No

☐

AI-generated content can unintentionally reveal sensitive information if the generative AI model has access to unsecured data sources.

☒☐

To prevent data exposure, only the prompts used by users must be protected by using policies.

☐☒

Explanation:

Box 1: Yes

Yes - Content filtering controls can prevent AI-generated responses from exposing confidential and sensitive information.

Content filtering controls are a critical safeguard for preventing AI-generated responses from inadvertently exposing confidential or sensitive information. These controls operate as

"guardrails" by inspecting data at both the input (prompt) and output (completion) stages.

Box 2: Yes

Yes - AI-generated content can unintentionally reveal sensitive information if the generative AI model has access to unsecured data source.

Unsecured data sources significantly increase the risk of AI-generated content exposing sensitive information through several mechanisms. Because generative AI models are "data-hungry" and often lack transparent data boundaries, they can absorb and later reproduce confidential data they were exposed to during training or operation.

Box 3: No

No - To prevent data exposure, only the prompts used by users must be protected by using policies.

While protecting user prompts is a critical first step, it is not sufficient on its own to prevent data exposure. Relying solely on prompt policies leaves significant gaps where sensitive data can still leak through other vectors.

### NEW QUESTION # 68

Your company plans to use generative AI to help project managers and engineers work with construction blueprints stored as PDF files. You need to recommend a generative AI solution that processes both images and text, summarizes building design, answers questions, and extracts information such as locations of electrical, heating, and plumbing systems. What should you recommend?

- A. a document summarization solution
- B. a multi-modal solution
- C. a text completion solution
- D. an optical character recognition OCR solution

Answer: B

Explanation:

Construction blueprints in PDFs often contain a mix of text, symbols, linework, and diagrams. The requirements include

understanding both visual layout (where systems are located) and textual annotations, producing summaries, and answering Q & A. That combination requires a multimodal generative AI approach-models that can reason over images and text together. Therefore, A is best.

OCR alone (B) can extract printed text, but it won't reliably interpret diagram geometry, symbols, or spatial relationships (e.g., "electrical riser is on the east core near gridline B-4"). Text completion (C) is too generic and doesn't address image understanding. Document summarization (D) is only one requirement (summary) and still depends on first extracting/understanding both visual and textual elements.

A multimodal solution can ingest the PDF pages as images (or rendered page images) plus extracted text, then answer questions grounded in both modalities. In practice, you may combine OCR and layout extraction with a multimodal LLM so the model can reference drawing regions, legends, callouts, and system diagrams to produce accurate explanations and field extractions.

#### NEW QUESTION # 69

A marketing team wants to automatically create product descriptions and campaign email drafts. Which generative AI capability best meets this business need?

- A. Predictive demand forecasting
- **B. Natural language content generation**
- C. Image classification
- D. Anomaly detection

**Answer: B**

Explanation:

Natural language content generation is correct because Natural language content generation enables the creation of product descriptions, emails, blogs, and other written materials using prompts. This directly supports marketing automation and content scaling.

#### NEW QUESTION # 70

You plan to meet with a group of stakeholders to discuss how generative AI can benefit your company. You need to provide the stakeholders with a relevant description of generative AI during the meeting. Which description should you use?

- A. Generative AI is designed to recommend products based on user behavior.
- B. Generative AI is designed to predict future trends based on historical data.
- **C. Generative AI is designed to generate responses based on a user's natural language prompts.**
- D. Generative AI is designed to translate documents into other languages.

**Answer: C**

Explanation:

Generative AI's defining characteristic is that it creates new content (text, images, code, summaries, drafts) in response to instructions-most commonly natural language prompts. Option C captures that general-purpose description in a stakeholder-friendly way: users provide prompts and the system generates responses or content. This framing is broad enough to cover common business value scenarios such as summarizing documents, drafting communications, creating marketing copy, generating reports, building assistants, and producing structured outputs from unstructured requests.

Option A is a single use case (translation), not the defining description. Option B describes predictive analytics/forecasting, which is a different AI category focused on outcomes and probabilities rather than content creation. Option D describes recommendation systems, typically driven by ranking/behavioral signals; while AI can enhance recommendations, that is not the core definition of generative AI. Therefore, the most accurate and relevant description for stakeholders is C.
