Latest Released Amazon New SCS-C03 Practice Questions: AWS Certified Security - Specialty & SCS-C03 Valid Exam Blueprint

Even in a globalized market, the learning material of similar SCS-C03 doesn't have much of a share, nor does it have a high reputation or popularity. In this dynamic and competitive market, the SCS-C03 study materials can be said to be leading and have absolute advantages. In order to facilitate the user real-time detection of the learning process, we SCS-C03 practice materials provided by the questions and answers are all in the past.it is closely associated, as our experts in constantly update products every day to ensure the accuracy of the problem, so all SCS-C03 practice materials are high accuracy.

As we all know, it is difficult to prepare the SCS-C03 exam by ourselves. Excellent guidance is indispensable. If you urgently need help, come to buy our study materials. Our company has been regarded as the most excellent online retailers of the SCS-C03 exam question. So our assistance is the most professional and superior. You can totally rely on our study materials to pass the exam. All the key and difficult points of the SCS-C03 exam have been summarized by our experts. They have rearranged all contents, which is convenient for your practice. Perhaps you cannot grasp all crucial parts of the SCS-C03 Study Tool by yourself. You also can refer to other candidates' review guidance, which might give you some help. Then we can offer you a variety of learning styles. Our printable SCS-C03 real exam dumps, online engine and windows software are popular among candidates. So you will never feel bored when studying on our SCS-C03 study tool.

Amazon New SCS-C03 Practice Questions - Realistic AWS Certified Security - Specialty Valid Exam Blueprint 100% Pass Quiz

Since our SCS-C03 study guide have veried versions which contain the PDF, Softwate and APP online, you can study whenever you are or even offline state according to their different merits. In addition, Our SCS-C03 training quiz will be very useful for you to improve your learning efficiency, because you can make full use of your all spare time to do test. It will bring a lot of benefits for you beyond your imagination if you buy our SCS-C03 Study Materials.

Amazon AWS Certified Security - Specialty Sample Questions (Q38-Q43):

NEW QUESTION # 38
A company has AWS accounts in an organization in AWS Organizations. The organization includes a dedicated security account. All AWS account activity across all member accounts must be logged and reported to the dedicated security account. The company must retain all the activity logs in a secure storage location within the dedicated security account for 2 years. No changes or deletions of the logs are allowed.
Which combination of steps will meet these requirements with the LEAST operational overhead?
(Select TWO.)

- A. Turn on AWS CloudTrail in each account and forward logs to the dedicated security account by using AWS Lambda and Amazon Data Firehose.
- B. In the dedicated security account, create an Amazon S3 bucket. Configure S3 Object Lock in compliance mode with a

retention period of 2 years. Set the bucket policy to allow the organization's member accounts to write to the S3 bucket.
- C. Create an AWS CloudTrail organization trail. Configure logs to be delivered to the Amazon S3 bucket in the dedicated security account.
- D. In the dedicated security account, create an Amazon S3 bucket with an S3 Lifecycle configuration that expires objects after 2 years. Allow member accounts to write to the bucket.
- E. In the dedicated security account, create an Amazon S3 bucket. Configure S3 Object Lock in compliance mode with a retention period of 2 years. Set the bucket policy to allow the organization's management account to write to the S3 bucket.

Answer: C,E

Explanation:
AWS CloudTrail organization trails are specifically designed to provide centralized, organization- wide logging with minimal operational effort. According to the AWS Certified Security - Specialty Official Study Guide, an organization trail records all management events for all member accounts and delivers them to a single Amazon S3 bucket.
To ensure that logs cannot be altered or deleted, Amazon S3 Object Lock in compliance mode must be used. Compliance mode enforces write-once-read-many (WORM) protection, meaning no user, including the root user, can delete or modify objects before the retention period expires.
This directly satisfies the requirement that no changes or deletions are allowed for 2 years.
The S3 bucket must reside in the dedicated security account to provide isolation and strong security boundaries. Granting write permissions to the organization's management account (Option A) aligns with AWS best practices, because the management account owns and manages the organization trail and centrally delivers logs on behalf of all member accounts.

NEW QUESTION # 39
A company runs a web application on a fleet of Amazon EC2 instances in an Auto Scaling group. Amazon GuardDuty and AWS Security Hub are enabled. The security engineer needs an automated response to anomalous traffic that follows AWS best practices and minimizes application disruption.
Which solution will meet these requirements?

- A. Send GuardDuty findings to Amazon SNS for email notification.
- B. Use EventBridge to invoke a Lambda function that removes the affected instance from the Auto Scaling group and isolates it with a restricted security group.
- C. Use EventBridge to disable the instance profile access keys.
- D. Use Security Hub to update the subnet network ACL to block traffic.

Answer: B

Explanation:
AWS incident response best practices emphasize isolating compromised resources rather than immediately terminating them.
According to AWS Certified Security - Specialty documentation, removing an instance from an Auto Scaling group prevents replacement loops, while applying a restrictive security group isolates the instance for forensic analysis.
Using Amazon EventBridge to trigger an AWS Lambda function enables automated, consistent responses to GuardDuty findings.
This approach minimizes disruption to the application because healthy instances continue serving traffic while the affected instance is isolated.
Disabling credentials or modifying network ACLs can have broader impact on unrelated workloads. SNS notifications alone do not provide response automation.
AWS recommends isolate-and-investigate patterns for EC2 incident response.

NEW QUESTION # 40
A company's data scientists use Amazon SageMaker with datasets stored in Amazon S3. Data older than 45 days must be removed according to policy. Which action should enforce this policy?

- A. Create a scheduled Lambda function to delete old objects monthly.
- B. Configure S3 Intelligent-Tiering.
- C. Create a Lambda function triggered on object upload to delete old data.
- D. Configure an S3 Lifecycle rule to delete objects after 45 days.

Answer: D

Explanation:
Amazon S3 Lifecycle rules are the native and most efficient way to enforce data retention policies. AWS Certified Security - Specialty documentation recommends lifecycle rules over custom automation to reduce operational complexity and failure risk. Lifecycle rules automatically and reliably delete objects after a specified age, ensuring compliance without additional compute services. Lambda-based solutions increase cost and management overhead. Intelligent-Tiering manages storage cost, not data deletion.

NEW QUESTION # 41

A company has the following security policy for its Amazon Aurora MySQL databases for a single AWS account:
* Database storage must be encrypted at rest.
* Deletion protection must be enabled.
* Databases must not be publicly accessible.
* Database audit logs must be published to Amazon CloudWatch Logs.
A security engineer must implement a solution thatcontinuously monitorsall Aurora MySQL resources for compliance with this policy. The solution must be able to display a database's compliance state for each part of the policy at any time.
Which solution will meet these requirements?

- A. Enable AWS Audit Manager. Configure Audit Manager to use a custom framework that matches the security requirements. Create an assessment report to view the compliance state.
- B. Create an Amazon EventBridge rule that runs when an Aurora MySQL resource is created or modified.Create an AWS Lambda function to verify the security requirements and to send the compliance state to a CloudWatch custom metric.
- C. Enable AWS Security Hub. Create a configuration policy that includes the security requirements. Apply the configuration policy to all Aurora MySQL resources. View the compliance state in Security Hub.
- D. Enable AWS Config. Implement AWS Config managed rules that monitor all Aurora MySQL resources for the security requirements. View the compliance state in the AWS Config dashboard.

Answer: D

Explanation:
AWS Config is a fully managed service that providescontinuous monitoring and evaluation of AWS resource configurationsagainst desired configuration baselines. According to the AWS Certified Security - Specialty Official Study Guide, AWS Config is the primary service used totrack configuration changes, evaluate compliance in near real time, and display compliance statesfor individual AWS resources.
AWS Config providesmanaged rulesthat directly map to the listed Aurora MySQL security requirements, including encryption at rest, public accessibility, deletion protection, and log exports to CloudWatch Logs.
These managed rules continuously evaluate resources and mark them as compliant or noncompliant whenever a configuration change occurs.
The AWS Config dashboard enables security engineers to viewper-resource and per-rule compliance states at any point in time, satisfying the requirement to display compliance status for each part of the policy.
AWS Audit Manager (Option A) is designed for audit evidence collection and reporting, not continuous monitoring. AWS Security Hub (Option C) aggregates findings from other services but relies on AWS Config for configuration compliance data. Option D introduces unnecessary custom logic and does not provide a native compliance dashboard.
AWS documentation explicitly identifiesAWS Config as the authoritative service for continuous compliance monitoring and visibility.

NEW QUESTION # 42

A company has a PHP-based web application that uses Amazon S3 as an object store for user files. The S3 bucket is configured for server-side encryption with Amazon S3 managed keys (SSE-S3). New requirements mandate full control of encryption keys.
Which combination of steps must a security engineer take to meet these requirements? (Select THREE.)

- A. Create an AWS managed key for Amazon S3 in AWS KMS.
- B. Change the SSE-S3 configuration on the S3 bucket to server-side encryption with customer-provided keys (SSE-C).
- C. Change all the S3 objects in the bucket to use the new encryption key.
- D. Create a new customer managed key in AWS Key Management Service (AWS KMS).

Answer: C,D,E

Explanation:
SSE-S3 uses AWS-managed keys and does not provide customer control. AWS Certified Security - Specialty documentation states that SSE-KMS with customer managed keys allows full control, auditing, and key rotation. The security engineer must first create a customer managed KMS key, then update the bucket to use SSE-KMS. Existing objects must be re-encrypted to ensure compliance.
SSE-C requires the application to manage keys, increasing complexity and risk. AWS managed keys do not meet the requirement for customer-controlled encryption.
