Identity-and-Access-Management-Architect試験の準備方法 | 権威のあるIdentity-and-Access-Management-Architect独学書籍試験 | 実際のSalesforce Certified Identity and Access Management Architect日本語版対応参考書

現在の急速的な発展に伴い、人材に対する要求がますます高くなってきます。国際的なIdentity-and-Access-Management-Architect認定試験資格証明書を持たれば、多くの求職者の中できっと目立っています。私たちのIdentity-and-Access-Management-Architect問題集はあなたの競争力を高めることができます。つまり、私たちのIdentity-and-Access-Management-Architect問題集を利用すれば、Identity-and-Access-Management-Architect認定試験資格証明書を取ることができます。それはちょうどあなたがもらいたい物ではないでしょうか？

Salesforce認定IDおよびアクセス管理アーキテクトの認定試験を受講するには、個人がSalesforceのIAMアーキテクチャとその関連技術を確実に理解する必要があります。また、組織向けのIAMソリューションの設計と実装の経験も必要です。この認定により、専門家は自分の専門知識を実証し、雇用市場で差別化することができます。

Salesforce Certified IdentityおよびAccess Management Architect認定試験は、Salesforceと協力し、IDとアクセス管理の分野に特化したい専門家に最適です。この試験は、アイデンティティとアクセス管理の分野でスキルと知識を向上させたい専門家にも適しています。この試験に成功した候補者は、アイデンティティとアクセス管理の分野での専門知識を実証することができ、アイデンティティとアクセス管理ソリューションを設計、実装、およびアクセスする能力を実証することができます。

Salesforce Certified Identity and Access Management Architect 認定 Identity-and-Access-Management-Architect 試験問題 (Q109-Q114):

質問 # 109

Universal Containers (UC) is setting up delegated authentication to allow employees to log in using their corporate credentials. UC's security team is concerned about the risks of exposing the corporate login service on the internet and has asked that a reliable trust mechanism be put in place between the login service and Salesforce.

What mechanism should an Architect put in place to enable a trusted connection between the login service and Salesforce?

- A. Include Client Id and Client Secret in the login header callout.
- B. Require the use of Salesforce security tokens on passwords.
- **C. Enforce mutual authentication between systems using SSL.**
- D. Set up a proxy service for the login service in the DMZ.

正解: C

解説:

To enable a trusted connection between the login service and Salesforce, an architect should enforce mutual authentication between systems using SSL. Mutual authentication, also known as two-way SSL or client certificate authentication, is a process in which both parties in a communication exchange certificates to verify their identities⁷. This mechanism ensures that only authorized systems can access each other's resources and prevents unauthorized access or spoofing attacks⁸. To use mutual authentication with delegated authentication, you need to do the following steps⁹:

- * Generate a self-signed certificate in Salesforce and download it.
- * Import the certificate into your login service's truststore.
- * Configure your login service to require client certificates for incoming requests.
- * Generate a certificate for your login service and export it.
- * Import the certificate into Salesforce's certificate and key management tool.
- * Enable mutual authentication for your login service's endpoint URL in Salesforce.

Set Up Mutual Authentication

質問 # 110

How should an Architect automatically redirect users to the login page of the external Identity provider when using an SP-Initiated SAML flow with Salesforce as a Service Provider?

- A. Enable the Redirect to the Identity Provider setting under Authentication Services on the My domain Configuration.
- B. Use visualforce as the landing page for My Domain to redirect users to the Identity Provider login Page.
- C. Set the Identity Provider as default and enable the Redirect to the Identity Provider setting on the SAML Configuration.
- **D. Remove the Login page from the list of Authentication Services on the My Domain configuration.**

正解: D

質問 # 111

Universal Containers (UC) operates in Asia, Europe and North America regions. There is one Salesforce org for each region. UC is implementing Customer 360 in Salesforce and has procured External Identity and Customer Community licenses in all orgs.

Customers of UC use Community to track orders and create inquiries. Customers also tend to move across regions frequently.

What should an identity architect recommend to optimize license usage and reduce maintenance overhead?

- A. Merge three orgs into one instance of Salesforce. This will no longer require maintaining three separate copies of the same customer.
- B. Enable Contactless User in all orgs and downgrade users from Experience Cloud license to External Identity license once users have moved out of that region.
- **C. Contacts are required since Community access needs to be enabled. Maintenance is a necessary overhead that must be handled via data integration.**
- D. Delete contact/ account records and deactivate user if user moves from a specific region; Sync will no longer be required.

正解: C

質問 # 112

A service provider (SP) supports both Security Assertion Markup Language (SAML) and OpenID Connect (OIDC). When integrating this SP with Salesforce, which use case is the determining factor when choosing OIDC or SAML?

- A. OIDC is more secure than SAML and therefore is the obvious choice.
- B. If the user has a session on Salesforce, you do not want them to be prompted for a username and password when they login to the SP.
- C. They are equivalent protocols and there is no real reason to choose one over the other.
- D. The SP needs to perform API calls back to Salesforce on behalf of the user after the user logs in to the service provider.

正解: D

解説:

Explanation

When integrating a SP that supports both SAML and OIDC with Salesforce, the use case that is the determining factor when choosing OIDC or SAML is whether the SP needs to perform API calls back to Salesforce on behalf of the user after the user logs in to the service provider. OIDC is a protocol that allows users to authorize an external application to access Salesforce resources on their behalf. OIDC provides an access token that can be used to call Salesforce APIs. SAML is a protocol that allows users to authenticate and authorize with an external identity provider and access Salesforce resources. SAML does not provide an access token, but only a session ID that can be used for web-based access. Therefore, if the SP needs to perform API calls back to Salesforce, OIDC is the preferred choice over SAML. References: OpenID Connect, SAML, Authorize Apps with OAuth

質問 # 113

Universal Containers (UC) is planning to deploy a custom mobile app that will allow users to get e-signatures from its customers on their mobile devices. The mobile app connects to Salesforce to upload the e-signature as a file attachment and uses OAuth protocol for both authentication and authorization. What is the most recommended and secure OAuth scope setting that an Architect should recommend?

- A. Custom_permissions
- B. Web
- C. Id
- D. Api

正解: A

解説:

Explanation

The most recommended and secure OAuth scope setting for UC's custom mobile app is custom_permissions.

Custom_permissions are settings that can be used in Apex code or validation rules to check whether a user has access to a custom feature or functionality. Custom_permissions can also be used as OAuth scopes to limit the access of an external application, such as UC's mobile app, to certain custom features or functionalities in Salesforce. By configuring custom_permissions as OAuth scopes in the connected app settings, UC can restrict the mobile app access to only the e-signature feature and protect against unauthorized or excessive access.

The other options are not recommended or secure OAuth scope settings for UC's custom mobile app. Id is an OAuth scope that allows the mobile app to access basic information about the user and their org, such as name, email, profile picture, and instance URL. This scope does not provide any access to Salesforce data or features, such as uploading e-signatures. Web is an OAuth scope that allows the mobile app to access Salesforce data and features through a browser or web-view. This scope provides full access to Salesforce data and features, which could expose sensitive information or allow unwanted actions. Api is an OAuth scope that allows the mobile app to make REST or SOAP API calls to Salesforce using the access token. This scope also provides full access to Salesforce data and features, which could compromise security and compliance.
