Free PDF Confluent - CCAAK - Confluent Certified Administrator for Apache Kafka Useful Cert Exam

If you want to pass the Confluent CCAAK exam on the first attempt then we suggest you start this journey with Confluent CCAAK exam dumps. The Confluent CCAAK PDF dumps file, practice test software, and web-based practice test software, all three Confluent CCAAK Exam Questions formats are ready for download.

Confluent CCAAK Exam Syllabus Topics:

Topic	Details
Topic 1	• Apache Kafka® Fundamentals: This section of the exam measures skills of a Kafka Administrator and covers core concepts such as Kafka architecture, components, and data flow. It assesses the candidate's understanding of topics like topics and partitions, brokers, producers, consumers, and message retention.
Topic 2	• Kafka Connect: This section of the exam measures skills of a Site Reliability Engineer and addresses the use and management of Kafka Connect for data integration. It includes setting up connectors, managing configurations, and ensuring efficient movement of data between Kafka and external systems.
Topic 3	• Apache Kafka® Security: This section of the exam measures skills of a Site Reliability Engineer and focuses on securing Kafka environments. It includes authentication mechanisms such as TLS and SASL, authorization using ACLs, and encrypting data at rest and in transit to ensure secure communication and access control.

Confluent Certified Administrator for Apache Kafka Sample Questions (Q53-Q58):

NEW QUESTION # 53
If the Controller detects the failure of a broker that was the leader for some partitions, which actions will be taken? (Choose two.)

- A. The Controller sends the new leader and ISR list changes to all producers and consumers.
- B. The Controller persists the new leader and ISR list to ZooKeeper.
- C. The Controller waits for a new leader to be nominated by ZooKeeper.
- D. The Controller sends the new leader and ISR list changes to all brokers.

Answer: B,D

Explanation:
The Controller updates ZooKeeper with the new leader and in-sync replica (ISR) information to maintain metadata consistency. Brokers need this information to correctly route client requests and continue replication.

NEW QUESTION # 54
Which tool is used for scalably and reliably streaming data between Kafka and other data systems?

- A. Kafka Streams
- B. Kafka Schema Registry
- C. Kafka Connect
- D. Kafka REST Proxy

Answer: C

Explanation:
Kafka Connect is the tool designed for scalable and reliable integration between Kafka and external data systems (e.g., databases, cloud storage, key-value stores). It supports source connectors (to pull data into Kafka) and sink connectors (to push data from Kafka).

NEW QUESTION # 55
You have an existing topic t1 that you want to delete because there are no more producers writing to it or consumers reading from it. What is the recommended way to delete the topic?

- A. Delete the log files and their corresponding index files from the leader broker.
- B. If topic deletion is enabled on the brokers, delete the topic using Kafka command line tools.
- C. Delete the offsets for that topic from the consumer offsets topic.

- D. The consumer should send a message with a 'null' key.

Answer: B

Explanation:
The recommended and safe method to delete a topic is to use the Kafka CLI tool kafka-topics.sh --delete command, provided that delete.topic.enable=true is set on the brokers.

NEW QUESTION # 56

An employee in the reporting department needs assistance because their data feed is slowing down. You start by quickly checking the consumer lag for the clients on the data stream.
Which command will allow you to quickly check for lag on the consumers?

- A. bin/kafka-consumer-group-throughput.sh
- B. bin/kafka-consumer-groups.sh
- C. bin/kafka-reassign-partitions.sh
- D. bin/kafka-consumer-lag.sh

Answer: B

Explanation:
The kafka-consumer-groups.sh script is used to inspect consumer group details, including consumer lag, which indicates how far behind a consumer is from the latest data in the partition.
The typical usage is bin/kafka-consumer-groups.sh --bootstrap-server <broker> --describe --group <group_id>

NEW QUESTION # 57

You are managing a cluster with a large number of topics, and each topic has a lot of partitions. A team wants to significantly increase the number of partitions for some topics.
Which parameters should you check before increasing the partitions?

- A. Check the max open file count on brokers.
- B. Check the producer batch size and buffer size.
- C. Check if compression is being used.
- D. Check if acks=all is beina used.

Answer: A

Explanation:
Each Kafka partition maps to multiple log segment files, and each segment results in open file descriptors on the broker. When the number of partitions increases significantly, it can exceed the OS-level limit for open files per broker process, leading to failures or degraded performance. Therefore, it is essential to check and possibly increase the ulimit -n (max open files) setting on the broker machines.

NEW QUESTION # 58

......

You will find that it is easy to buy our CCAAK exam questions, as you add them to the cart and pay for them. You can receive them in 5 to 10 minutes and then you can study at once. What's more, during the whole year after purchasing, you will get the latest version of our CCAAK Study Materials for free. You can see it is clear that there are only benefits for you to buy our CCAAK learning guide, so why not just have a try right now?
