## **Top Features of GuideTorrent NCP-MCA Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) PDF Questions File and Practice Test Software**

Our product boosts many advantages and it is worthy for you to buy it. You can have a free download and tryout of our NCP-MCA Exam torrents before purchasing. After you purchase our product you can download our NCP-MCA study materials immediately. We will send our product by mails in 5-10 minutes. We provide free update and the discounts for the old client. If you have any doubts or questions you can contact us by mails or the online customer service personnel and we will solve your problem as quickly as we can.

## **Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q12-Q17):**

### **NEW QUESTION # 12**

An administrator needs to create a Playbook to be notified when VMs are deleted. Which X-Play Trigger would satisfy this task?

- A. Event
- B. Audit
- C. Time

- **D. Alert**

**Answer: D**

### NEW QUESTION # 13

Which feature of Calm allows for the creation of task-based automation against dynamic lists of Windows or Linux VMs?

- A. Blueprints
- B. Playbooks
- **C. Runbooks**
- D. Projects

**Answer: C**

Explanation:

Runbooks are a feature of Calm that allows for the creation of task-based automation against dynamic lists of Windows or Linux VMs. A runbook is a collection of tasks that can be executed on one or more VMs or services. A task is a unit of automation that can perform actions such as executing commands, running scripts, invoking APIs, or sending notifications. A runbook can be triggered manually, on a schedule, or based on an event. Runbooks can be used to automate common operations such as backup, restore, patching, scaling, or troubleshooting. Reference: Nutanix Certified Professional - Multicloud Automation (NCP-MCA) Exam Blueprint Guide, page 16; Nutanix Calm User Guide, section 3.4.

### NEW QUESTION # 14

An administrator has run a multi-step Playbook. but sees the Failed status, as shown in the exhibit. What could be causing the playbook to fail?

- **A. IP Address SSH action has a timeout of 5 minutes.**
- B. puppet action has a timeout of 5 minutes.
- C. VM action has a timeout of 5 minutes.
- D. PowerShell action has a timeout of 5 minutes.

**Answer: A**

Explanation:

The image shows a failed status for an SSH\_VM\_Task, which is manually triggered. Since the task involves SSH, it's likely that the IP Address SSH action has a timeout of 5 minutes, causing the playbook to fail if it cannot complete within this time frame. The IP Address SSH action is used to execute commands on a remote VM using SSH. It requires the IP address, username, password, and command to run as inputs. The timeout parameter specifies how long the action will wait for the command to finish before aborting. If the timeout is too short, the action may fail due to network latency, slow execution, or other factors. Reference: Nutanix Certified Professional - Multicloud Automation (NCP-MCA) 6.5 Exam, page 16, section 1.3.2.2: "Playbooks" [Nutanix University: NCP-MCA 6.5 Exam Prep - Playbooks], video 4: "Playbooks"

### NEW QUESTION # 15

Which two items are required to create a Category via automation? (Choose two.)

- **A. Value**
- **B. Name**
- C. Tags
- D. Purpose

**Answer: A,B**

Explanation:

To create a Category via automation in Nutanix, the required items are:

Name: The identifier for the category.

Value: The specific value assigned to the category.

Categories help in organizing and managing resources by tagging them with meaningful identifiers.

Reference:

Nutanix documentation on Creating Categories.  
Nutanix Best Practices for Category Management.

### NEW QUESTION # 16

What two pieces of information can an administrator obtain from Plays? (Choose two.)

- A. Execution result status
- B. Start time and end time of each action
- C. Host where the action runs
- D. CVM IP where the alert was triggered

**Answer: A,C**

Explanation:

Plays are event-driven automation workflows that can be triggered by alerts, schedules, or manual actions.

They consist of one or more actions that run on specified hosts or clusters. An administrator can obtain the following information from Plays:

\* Host where the action runs: Each action in a Play can be configured to run on a specific host or cluster, or on the host or cluster where the alert was triggered. The administrator can view the host or cluster name for each action in the Play details page.

\* Execution result status: Each action in a Play has an execution result status that indicates whether the action was successful, failed, skipped, or cancelled. The administrator can view the status for each action in the Play details page, as well as the overall status of the Play.

The other options are incorrect because:

\* Start time and end time of each action: Plays do not show the start time and end time of each action, only the duration of the action. The administrator can view the duration for each action in the Play details page, as well as the overall duration of the Play.

\* CVM IP where the alert was triggered: Plays do not show the CVM IP where the alert was triggered, only the host or cluster name where the alert was triggered. The administrator can view the host or cluster name for the alert in the Play details page.
