

New C1000-189 Exam Camp - Latest IBM IBM Instana Observability v1.0.277 Administrator - Professional - C1000-189 Reliable Test Sample

BONUS!!! Download part of TestkingPass C1000-189 dumps for free: <https://drive.google.com/open?id=1m37R-cxLcpRqN6xnjbZSMdvl7M6gxwXy>

As long as you study with our C1000-189 exam braindump, you can find that it is easy to study with the C1000-189 exam questions. Therefore, even ordinary examiners can master all the learning problems without difficulty. In addition, C1000-189 candidates can benefit themselves by using our test engine and get a lot of test questions like exercises and answers. They will help them modify the entire syllabus in a short time. The most important thing is that our C1000-189 Practice Guide can help you obtain the certification without difficulty.

IBM C1000-189 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Installation: This section of the exam measures the skills of System Implementation Specialists and focuses on installing and deploying Instana across different environments. It includes installing the Instana backend, deploying and configuring agents, and migrating existing Instana setups. Candidates will also demonstrate their ability to implement Synthetic Monitoring and manage Points of Presence (PoPs) effectively for end-to-end performance validation.
Topic 2	<ul style="list-style-type: none">Configuration: This section of the exam measures the skills of DevOps Administrators and evaluates their ability to configure and optimize Instana operational settings. It involves setting up business process monitoring, configuring both cloud and serverless agents, and defining agent proxy parameters. Candidates will learn to implement various technologies and sensors, manage OpenTelemetry integrations, set up smart alerts, create service naming rules, and define custom SLIs and payloads for alert channels. Managing licenses and ensuring proper configuration of alerts and notifications are also key components of this domain.

Topic 3	<ul style="list-style-type: none"> • Troubleshooting: This section of the exam measures the skills of System Support Engineers and focuses on resolving technical and operational issues in Instana. It includes configuring log levels, collecting logs for debugging, and identifying connectivity issues between agents and the backend. Candidates will troubleshoot installation failures, diagnose communication problems, and apply corrective measures to ensure consistent Instana performance and stability across environments.
Topic 4	<ul style="list-style-type: none"> • Security and Compliance: This section of the exam measures the skills of IT Security Analysts and focuses on the data protection and compliance aspects of Instana deployment. Candidates must describe and implement data retention policies, plan for regulatory compliance, secure APIs, manage user access, and interpret audit logs. The goal is to ensure secure system configurations that align with organizational and regulatory standards.

C1000-189 Reliable Test Sample, Test C1000-189 Cram

A good brand is not a cheap product, but a brand that goes well beyond its users' expectations. The value of a brand is that the C1000-189 exam questions are more than just exam preparation tool -- it should be part of our lives, into our daily lives. Do this, therefore, our C1000-189 question guide has become the industry well-known brands, but even so, we have never stopped the pace of progress, we have been constantly updated the C1000-189 real study dumps. The most important thing is that the C1000-189 exam questions are continuously polished to be sold, so that users can enjoy the best service that our products bring. Our C1000-189 real study dumps provide users with comprehensive learning materials, so that users can keep abreast of the progress of The Times.

IBM Instana Observability v1.0.277 Administrator - Professional Sample Questions (Q11-Q16):

NEW QUESTION # 11

Which two thresholds can be chosen in Advanced Mode when setting up a Smart Alert?

- A. Single
- B. Progressive
- C. Neutral
- **D. Static**
- **E. Adaptive**

Answer: D,E

Explanation:

Instana Smart Alerts provide intelligent, context-aware alerting capabilities. In Advanced Mode, administrators can choose between two distinct threshold types: Static and Adaptive. The IBM Instana documentation details: "Advanced Mode supports both static and adaptive thresholds, letting users define explicit limit values or rely on adaptive baselines derived from historical data." Static thresholds are fixed, user-defined values best suited for predictable workloads or regulatory uptime scenarios. Adaptive thresholds use machine learning on time-series historical behavior to automatically adjust boundaries when traffic patterns or operating baselines change. This significantly reduces false positives and ensures that alerts reflect true anomalies rather than normal variance. Both threshold types can trigger multi-level alerts and integrate with escalation policies. Static measures remain critical for SLIs requiring consistent control, while adaptive techniques optimize monitoring of microservices under fluctuating loads. IBM emphasizes combining these in practice to balance detected sensitivity across mixed systems, leveraging AI-driven dynamic configurations in adaptive mode as a key differentiator in its observability platform.

NEW QUESTION # 12

What is mandatory to use Instana REST APIs?

- **A. Token**
- B. Python
- C. Cookie

- D. CURL

Answer: A

Explanation:

Access to Instana's REST API is secured using authorization tokens—an industry-standard best practice for API authentication and traceability. IBM documentation says: "A personal or team API token is required to authenticate REST API calls." Tokens serve as credentials embedded in HTTP headers on each request, providing both identity and access control for the API consumer. Tokens are mandatory; without a valid token, any API requests are denied with a 401 Unauthorized error, regardless of whether a tool (such as CURL) is used. Tokens can be scoped for individual users (personal tokens) or teams (team tokens), enabling granular tracking and revocation as part of enterprise security policies. API tokens are generated from the Instana UI under the profile or team section. Cookies and raw client libraries (e.g., Python) are not authentication methods for Instana APIs.

NEW QUESTION # 13

At which level can AWS agent polling intervals for CloudWatch API be configured?

- A. Service
- B. Account
- C. Region
- D. Resource group

Answer: C

Explanation:

AWS monitoring through Instana involves integration with the CloudWatch API to retrieve platform and service metrics. The official IBM Instana Observability documentation affirms that polling intervals for CloudWatch can be set at the Region level. This means an administrator configures how frequently Instana's agent queries CloudWatch within each specified region independently. This level of granularity provides flexibility: for example, mission-critical regions may be monitored more frequently, while others are polled less often to reduce API costs or remain within AWS rate limits. The documentation specifies: "Instana Agents for AWS can be configured with a polling interval for CloudWatch that is set per Region to customize granularity and resource consumption." Polling cannot be set at the account, resource group, or individual service level in default configuration. Instana's region-based polling helps balance data accuracy and overhead, especially in global or multi-region deployments. If needed, changes are applied through YAML configuration or UI during AWS agent integration setup.

NEW QUESTION # 14

What is the default log level set to collect Log4j syslog for Instana agent configuration?

- A. Error
- B. Info
- C. Warning
- D. Debug

Answer: B

Explanation:

As outlined in the Instana agent deployment documentation, the default log level for gathering Log4j syslog information is Info. The documentation reads: "The default log level for syslog collection in Instana agents with Log4j integration is Info, enabling monitoring of operational and sensor activity without excessive diagnostic output." Info level is chosen as a best-practice default to log key events like agent startup, sensor activations, and health check results. Debug, Warning, and Error thresholds are for troubleshooting or failure analyses and may be set manually for deep inspection but are not preselected at install. Optimal Info-level logging ensures administrators receive actionable messages without burdening disk or log forwarding pipelines. Configuration files can be adjusted for verbose output; however, initial deployments and automated frameworks always rely on Info as the default value.

NEW QUESTION # 15

Which statement accurately describes the use of the agent key?

- A. It is used for both downloading Instana artifacts and deploying an instance.
- B. It is required only for downloading the license.
