Palo Alto Networks Cloud Security Professional Sample Questions (Q198-Q203):

NEW QUESTION # 198
How many CLI remediation commands can be added in a custom policy sequence?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:
You can define up to 5 CLI commands in a sequence for a multi-step automatic remediation workflow. Add the commands in the sequence you want them to execute and separate the commands with a semi colon. If any CLI command included in the sequence fails, the execution stops at that point.
The Prisma Cloud platform allows administrators to define up to 5 CLI commands in a sequence for a multi- step automatic remediation workflow. These commands should be added in the order they are intended to be executed and must be separated by a semicolon. If any CLI command in the sequence fails during execution, the process stops at that point. This feature enables administrators to automate the remediation process efficiently and effectively, ensuring that actions are taken in a specific order to address alerts or compliance issues.
This capability is detailed in the Prisma Cloud documentation under the section for configuring Prisma Cloud to automatically remediate alerts. It's an important feature for maintaining security and compliance in cloud environments, as it allows for quick and automated responses to identified issues.

NEW QUESTION # 199

NEW QUESTION # 200
Which statement is true regarding CloudFormation templates?

- A. A single template or a zip archive of template files cannot be scanned with a single API request.
- B. Scan support is provided for JSON, HTML and YAML formats.
- C. Scan support does not currently exist for nested references, macros, or intrinsic functions.
- D. Request-Header-Field 'cloudformation-version' is required to request a scan.

Answer: C

Explanation:
CloudFormation templates, used to describe and provision all the infrastructure resources in cloud environments, support various elements including resources, mappings, parameters, and outputs. However, scan support for CloudFormation templates does not currently exist for nested references, macros, or intrinsic functions (option A). These advanced CloudFormation features can introduce complexity in scanning and interpreting the templates accurately for security and compliance checks.

NEW QUESTION # 201
Which three actions are required in order to use the automated method within Azure Cloud to streamline the process of using remediation in the identity and access management (IAM) module? (Choose three.)

- A. Configure IAM AWS remediation script.
- B. Install boto3 & requests library.
- C. Configure IAM Azure remediation script.
- D. Install azure.servicebus & requests library.
- E. Integrate with Azure Service Bus.

Answer: C,D,E

Explanation:
To use the automated method within Azure Cloud for streamlining the process of using remediation in the identity and access management (IAM) module, the required actions include configuring the IAM Azure remediation script, integrating with Azure Service Bus, and installing the azure.servicebus & requests library.
These steps ensure that the automated remediation system can communicate effectively with Azure services, execute the necessary remediation actions, and address IAM-related alerts by adjusting permissions and access controls as needed. This automation helps maintain a secure and compliant cloud environment by promptly addressing potential IAM issues.

NEW QUESTION # 202
What is the primary purpose of Prisma Cloud Code Security?

- A. To offer instant feedback on application performance issues and bottlenecks
- B. To address cloud infrastructure misconfigurations in code before they become alerts or incidents
- C. To provide a platform for developers to create custom security policies for applications
- D. To triage alerts and incidents in realtime during deployment

Answer: B

Explanation:
Prisma Cloud Code Security is designed to integrate security into the DevOps process by scanning infrastructure as code (IaC) templates and configurations for potential security issues. This proactive approach allows developers and security teams to address misconfigurations and vulnerabilities in the code itself, before they are deployed into the cloud environment and become more challenging to resolve. By identifying and rectifying these issues early in the development lifecycle, organizations can reduce the risk of alerts and incidents arising from misconfigurations in their cloud infrastructure, leading to a more secure and compliant cloud environment.
