Cisco Designing Cisco Enterprise Wireless Networks Sample Questions (Q168-Q173):

NEW QUESTION # 168

Refer to the exhibit.

A WLC SSO pair is set up. Which failure scenario causes a split-brain scenario?

- A. One distribution port on the active WLC is down.
- B. Two distribution ports on the active WLC are down.
- **C. VSL is down.**
- D. RP is down.

Answer: C

NEW QUESTION # 169

A customer uses a Cisco Catalyst 9800 Series wireless controller to manage all of the APs for a campus network. Secure guest access is required for the guest network. A Cisco 5520 anchor controller is deployed within a DMZ. Which design approach ensures that the mobility tunnel is established successfully between the wireless controller and the anchor controller?

- A. Disable data link encryption on the anchor controller.
- **B. Run an Inter-Release Controller Mobility compatible software version on the anchor controller.**
- C. Run an Inter-Release Controller Mobility compatible software version on the wireless controller.
- D. Enable control plane encryption on the wireless controller.

Answer: B

NEW QUESTION # 170

A customer has a single anchor WLC named Anchor A. Anchor A is in a DMZ and provides guest access. The customer wants to deploy an additional anchor controller named Anchor B to provide redundancy if Anchor A fails. Which design approach should be taken for the guest WLAN priority on the foreign WLC for each anchor WLC?

- **A. Set Anchor A to priority 1 and Anchor B to priority 3.**
- B. Set Anchor A to priority 3 and Anchor B to priority 3.
- C. Set Anchor A to priority 1 and Anchor B to priority 1.
- D. Set Anchor A to priority 3 and Anchor B to priority 1.

Answer: A

Explanation:

In a wireless network design where redundancy is required for guest access, setting different priorities for the anchor controllers ensures that one serves as the primary and the other as a backup. Anchor A, being the primary controller, should have a higher priority (lower numerical value), making it the preferred choice for guest WLAN connections. Anchor B, as the secondary or backup controller, should have a lower priority (higher numerical value) so that it is used only if Anchor A fails. This approach provides a failover mechanism for guest access in the DMZ.

NEW QUESTION # 171

Campus users report a poor wireless experience. An engineer investigating the issue notices that in high-density areas, the wireless clients fail to switch the AP to which are automatically connected. This sticky client behavior is causing roaming issues. Which feature must the engineer configure?

- A. Layer 3 roaming
- B. Load balancing and band select
- **C. optimized roaming**
- D. Layer 2 roaming

Answer: C

Explanation:

Optimized roaming is a feature that helps mitigate sticky client behavior by assessing the client's signal strength and proactively disconnecting clients with a signal below a predefined threshold. This encourages clients to connect to a closer AP with a stronger signal, improving the overall wireless experience in high-density areas.

NEW QUESTION # 172

A customer has determined that aesthetics is a primary concern for their upcoming guest deployment. Which design consideration can be leveraged to address this concern?

- A. Deploy environmentally friendly cabling components to blend into the environment.
- B. Use enclosures to hide the wireless infrastructure in the surrounding environment.
- C. Paint the access point to cover the LED from being noticeable.
- D. Use AIR-AP-BRACKET-1 to allow for greater mounting locations

Answer: A

Explanation:

- Use cables that are resistive to bend loss if excessive bending of cables cannot be prevented due to installation constraints.
- Avoid mounting the cabling components in places that block accessibility to other equipment (such as a power strip or fans) in and out of the racks.

NEW QUESTION # 173
