It copies the exact pattern and style of the real CrowdStrike CCCS-203b Exam to make your preparation productive and relevant.

CrowdStrike Certified Cloud Specialist Sample Questions (Q162-Q167):

NEW QUESTION # 162

An organization must ensure that all virtual machines (VMs) across their multi-cloud infrastructure comply with specific regulatory standards, such as encryption at rest and proper tagging. Which rule category in Falcon Cloud Security should the team use to enforce these compliance requirements?

- A. Identity and Access Management Rules
- B. Network Security Rules

- C. Compute Security Rules
- D. DevOps Integration Rules

Answer: C

Explanation:

Option A: Compute Security Rules are designed to enforce policies for virtual machines and compute resources, including ensuring compliance with encryption, tagging, and other configuration standards.

Option B: Identity and Access Management (IAM) rules focus on user permissions, roles, and access policies. While important for security, they do not directly enforce VM encryption or tagging requirements.

Option C: Network Security Rules manage configurations like firewalls, traffic flows, and security groups. They do not address encryption at rest or VM tagging requirements.

Option D: DevOps Integration Rules focus on CI/CD pipeline integration and DevSecOps practices, which are unrelated to enforcing encryption or tagging on VMs.

NEW QUESTION # 163

Which of the following is a requirement for deploying the Kubernetes and Container Sensor in a Kubernetes cluster?

- A. The cluster must have the kube-proxy component disabled.
- B. All workloads in the cluster must use privileged containers.
- C. The sensor requires a DaemonSet to be deployed within the Kubernetes cluster.
- D. The cluster must have at least three nodes with GPU support.

Answer: C

Explanation:

Option A: Requiring all workloads to use privileged containers would create unnecessary security risks. The Kubernetes and Container Sensor can secure non-privileged containers, which is the recommended best practice for containerized workloads.

Option B: Disabling the kube-proxy component is not required for deploying the Kubernetes and Container Sensor. Kube-proxy is an essential component of Kubernetes networking, and its removal would break cluster functionality.

Option C: The Kubernetes and Container Sensor is typically deployed as a DaemonSet to ensure that a sensor pod is running on each node in the Kubernetes cluster. This enables comprehensive monitoring and threat detection across all workloads in the cluster. The DaemonSet is a standard Kubernetes construct for deploying cluster-wide services.

Option D: GPU support is not a requirement for deploying the Kubernetes and Container Sensor.

GPU nodes are only necessary for specific workloads, such as machine learning applications, and are unrelated to the sensor's deployment.

NEW QUESTION # 164

You are tasked with registering a new cloud account to CrowdStrike Falcon for monitoring and security purposes.

Which of the following steps must you complete to ensure successful cloud account registration?

- A. Enable two-factor authentication on the cloud account for all users.
- B. Manually configure endpoint agents on all virtual machines in the cloud account.
- C. Grant the CrowdStrike Falcon application the required permissions on the cloud provider.
- D. Delete all existing unused IAM roles before registering the account.

Answer: C

Explanation:

Option A: Granting the Falcon application the appropriate permissions ensures it can access logs, telemetry, and security configurations necessary for monitoring and protection. Without these permissions, Falcon cannot function correctly in the cloud environment.

Option B: Two-factor authentication is a general security best practice but not directly relevant to cloud account registration in Falcon. CrowdStrike integrates with the account through APIs and IAM permissions.

Option C: Deleting unused IAM roles is unnecessary and could disrupt existing configurations. This step does not contribute to successful cloud account registration.

Option D: While endpoint agents provide additional security, they are not a requirement for registering a cloud account. The account registration focuses on permissions and integrations, not endpoint installations.

NEW QUESTION # 165

You are tasked with reviewing container images to ensure they are secure before deploying them to production. Which of the following actions is the most critical first step in identifying vulnerabilities in container images?

- A. Testing the container in a production-like environment.
- B. Reviewing the container's resource utilization metrics.
- C. Scanning the container image with a vulnerability scanning tool.
- D. Manually inspecting the Dockerfile for insecure configurations.

Answer: C

Explanation:

Option A: While this helps identify runtime issues and integration problems, it does not address the specific task of reviewing an image for vulnerabilities. This step should come after ensuring the image is free from known vulnerabilities.

Option B: This is the correct answer because vulnerability scanning tools are specifically designed to identify known vulnerabilities in container images. These tools analyze both the image layers and dependencies, providing a comprehensive list of vulnerabilities that need to be addressed. This is a critical first step before proceeding with deeper analysis or deployment.

Option C: Resource utilization metrics are used for performance monitoring and optimization, not vulnerability identification. They do not provide any insights into the security posture of the container image.

Option D: This is an important step, but it is not the most critical first step. Manual inspection is prone to human error and cannot detect vulnerabilities in the underlying dependencies or base image layers.

NEW QUESTION # 166

Which of the following steps is essential when configuring an automated remediation dry run in CrowdStrike Falcon?

- A. Schedule the dry run to occur only during off-peak hours
- B. Integrate third-party tools for enhanced dry run reporting
- C. Enable enforcement mode to simulate real-world remediation
- D. Select a limited scope of affected resources to prevent wide-scale simulation

Answer: D

Explanation:

Option A: While integration with third-party tools may enhance monitoring and reporting, it is not essential for performing a dry run. The primary goal of a dry run is to validate the workflow within the platform.

Option B: When performing a dry run, it is important to limit the scope of affected resources to ensure the simulation is manageable and does not inadvertently include unnecessary or unrelated areas. This allows for precise evaluation of the workflow's effectiveness and helps in identifying issues without impacting the overall environment.

Option C: While off-peak scheduling may reduce operational overhead, it is not an essential requirement for dry runs. The focus is on testing the workflow, regardless of the time it is run.

Option D: Enforcement mode is used for applying actual remediation actions, not for a dry run. A dry run avoids execution of real-world actions, focusing solely on simulation.
