CWNP Certified Wireless IoT Solutions Administrator(2025 Edition) Sample Questions (Q69-Q74):

NEW QUESTION # 69

In a wireless link, as the signal strength decreases, what else may decrease?

- A. Interference
- **B. Transmission speeds**
- C. Latency
- D. Noise

Answer: B

Explanation:

Signal Strength and Data Rate: In wireless links, weaker signal strength often directly correlates to reduced transmission speeds.

Modern wireless technologies use adaptive modulation and coding, sacrificing speed for reliability when signals become weaker.

Noise and Interference: While these can impact performance, they don't inherently decrease simply because signal strength drops.

Latency: Latency can be affected by poor signal, but its primary drivers are distance and network congestion.

NEW QUESTION # 70

What function does the IEEE perform in relation to wireless technologies?

- A. Promotes technology and standards development
- B. Designs wireless chipsets
- C. Brings wireless products to market
- D. Certified equipment to be compatible

Answer: A

Explanation:

IEEE's Role: The Institute of Electrical and Electronics Engineers (IEEE) is a global organization critical in developing and promoting technical standards across various fields, including wireless technologies.

Standards Work: IEEE creates wireless technology standards like:

IEEE 802.11: Wi-Fi standards

IEEE 802.15.4: Basis for ZigBee, Thread, and other low-power networks

NEW QUESTION # 71

What organization maintains and publishes the 802.15.4 Standard?

- A. Bluetooth SIG
- B. IEEE
- C. IETF
- D. Zigbee Alliance

Answer: B

Explanation:

* IEEE 802.15.4: The IEEE 802.15.4 standard is a fundamental specification for low-rate wireless personal area networks (LR-WPANs). It serves as the basis for many wireless IoT protocols.

* IEEE's Role: The Institute of Electrical and Electronics Engineers (IEEE) is the organization responsible for creating, maintaining, and publishing the 802.15.4 standard.

NEW QUESTION # 72

In a Wi-Fi IoT deployment, which factor MOST affects the number of devices that can be supported by a single access point?

- A. The DHCP lease time
- B. The SSID name length
- C. The Ethernet cable type used
- D. Channel width and airtime utilization

Answer: D

Explanation:

Airtime utilization determines how many clients an AP can serve. Wider channels and high utilization reduce capacity. SSID names, DHCP timing, and cabling have minimal impact.

NEW QUESTION # 73

You are performing an implementation for a cloud-based wireless solution. How is connectivity to the cloud established? (Choose the single best answer.)

- A. Through the use of IPX/SPX routers
- B. Through cellular Internet connections only
- C. Through BLE Layer 2 connections that do not use IP
- D. Through any Layer 3 network connected to the Internet

Answer: D

Explanation:

Cloud Connectivity Relies on IP: Most cloud-based services operate via the internet, which utilizes Internet Protocol (IP) at Layer 3 of the network model.

Flexibility: Various Layer 2 technologies (Ethernet, Wi-Fi) can connect to a Layer 3 network that ultimately provides Internet access

BLE Exception: Bluetooth Low Energy can have cloud connectivity, but often through gateways and not as a direct Layer 2 connection.

Eliminating Incorrect Options: IPX/SPX is an outdated protocol, and cellular is only one possible way to achieve Internet access.

NEW QUESTION # 74
