## Palo Alto Networks Cybersecurity Practitioner Sample Questions (Q121-Q126):

### NEW QUESTION # 121

What role do containers play in cloud migration and application management strategies?

- A. They serve as a template manager for software applications and services.
- **B. They enable companies to use cloud-native tools and methodologies.**
- C. They are used for data storage in cloud environments.
- D. They are used to orchestrate virtual machines (VMs) in cloud environments.

**Answer: B**

Explanation:

Containers encapsulate applications and their dependencies into lightweight, portable units that can run consistently across multiple environments. This abstraction supports cloud-native development by enabling microservices architectures, rapid deployment, and scaling within orchestration platforms like Kubernetes. Containers accelerate cloud migration by decoupling applications from infrastructure, facilitating automation, and continuous integration/continuous deployment (CI/CD) workflows. Palo Alto Networks addresses container security by integrating runtime protection, vulnerability scanning, and compliance enforcement within its Prisma Cloud platform, ensuring safe adoption of cloud-native tools and methodologies.

### NEW QUESTION # 122

Which technique uses file sharing or an instant messenger client such as Meebo running over Hypertext Transfer Protocol (HTTP)?

- A. Port hopping
- **B. Tunneling within commonly used services**
- C. Use of non-standard ports
- D. Hiding within SSL encryption

**Answer: B**

Explanation:

Tunneling is a method of transporting data across a network using protocols that are not supported by that network. Tunneling works by encapsulating packets: wrapping packets inside of other packets. Tunneling within commonly used services is a technique that uses file sharing or an instant messenger client such as Meebo running over HTTP to bypass firewalls or other network restrictions. The data packets are encapsulated within HTTP packets and sent as normal web traffic. This way, the data packets can reach their destination without being blocked or detected by the network. ### NEW QUESTION # 123

Which network firewall primarily filters traffic based on source and destination IP address?

- A. Proxy
- B. Stateful
- C. Application
- **D. Stateless**

**Answer: D**

Explanation:

A stateless firewall is a network firewall that primarily filters traffic based on source and destination IP address, as well as port numbers and protocols. A stateless firewall does not keep track of the state or context of network connections, and only inspects packet headers. A stateless firewall is faster and simpler than a stateful firewall, but it is less secure and flexible. A stateless firewall cannot block complex attacks or inspect packet contents for malicious payloads. Reference: What Is a Packet Filtering Firewall? -

### NEW QUESTION # 124

What type of address translation does a NAT perform?

- A. Public to private
- B. Physical to logical
- C. Private to public
- D. Logical to physical

**Answer: C**

Explanation:

NAT stands for Network Address Translation, which is a process that allows devices on a private network to communicate with devices on a public network, such as the Internet. NAT translates the private IP addresses of the devices on the private network to public IP addresses that can be routed on the public network. This way, multiple devices on the private network can share a single public IP address and access the Internet. NAT also provides security benefits, as it hides the internal network structure and IP addresses from the outside world. ### NEW QUESTION # 125

A high-profile company executive receives an urgent email containing a malicious link. The sender appears to be from the IT department of the company, and the email requests an update of the executive's login credentials for a system update. Which type of phishing attack does this represent?

- A. Angler phishing
- B. Pharming
- C. Whaling
- D. Vishing

**Answer: C**

Explanation:

Whaling is a targeted phishing attack aimed at high-profile individuals, such as executives. The attacker impersonates a trusted entity (e.g., IT department) to trick the executive into revealing sensitive credentials. This is a form of spear phishing specifically focused on "big fish" targets.
