## Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q162-Q167):

### NEW QUESTION # 162

Which analysis detonates previously unknown submissions in a custom-built, evasion-resistant virtual environment to determine real-world effects and behavior?

- A. **Dynamic**
- B. Bare-metal
- C. Pre-exploit protection
- D. Static

**Answer: A**

Explanation:

Dynamic analysis is a method of malware analysis that executes the malware in a controlled environment and observes its behavior and effects. Dynamic analysis can reveal the malware's network activity, file system changes, registry modifications, and other indicators of compromise. Dynamic analysis is performed by Palo Alto Networks WildFire, a cloud-based service that analyzes unknown files and links from various sources, such as email attachments, web downloads, and firewall traffic. WildFire uses a custom-built, evasion-resistant virtual environment to detonate the submissions and generate detailed reports and verdicts. WildFire can also share the threat intelligence with other Palo Alto Networks products and partners to prevent future attacks. ### NEW QUESTION # 163

What are two common lifecycle stages for an advanced persistent threat (APT) that is infiltrating a network? (Choose two.)

- A. Deletion of critical data
- B. **Lateral movement**
- C. **Privilege escalation**
- D. Communication with covert channels

**Answer: B,C**

Explanation:

Lateral movement is a key stage where the attacker moves across the network to find valuable targets.

Privilege escalation involves gaining higher access rights to expand control within the compromised environment.

Communication with covert channels is a tactic used during persistence or exfiltration, while deletion of critical data is not a standard APT lifecycle stage - it's more characteristic of destructive attacks.

### NEW QUESTION # 164

and sandboxing?

- A. IoT security
- B. Advanced Threat Prevention
- C. DNS security
- **D. Advanced WildFire**

**Answer: D**

Explanation:

Advanced WildFire is a Cloud-Delivered Security Service (CDSS) that detects zero-day malware using inline cloud machine learning (ML) and sandboxing techniques. It analyzes unknown files in real-time to identify and block new threats before they can cause harm.

#### **NEW QUESTION # 165**

- A. exploitation
- B. delivery
- **C. weaponization**
- D. reconnaissance

**Answer: C**

Explanation:

"Weaponization: Next, attackers determine which methods to use to compromise a target endpoint. They may choose to embed intruder code within seemingly innocuous files such as a PDF or Microsoft Word document or email message."

#### **NEW QUESTION # 166**
