## How Can You Pass the 156-215.82 Exam Quickly and Easily?

Just register for the 156-215.82 examination and download 156-215.82 updated pdf dumps today. With these 156-215.82 real dumps you will not only boost your Check Point Certified Security Administrator - R82 test preparation but also get comprehensive knowledge about the Check Point Certified Security Administrator - R82 examination topics.

## CheckPoint Check Point Certified Security Administrator - R82 Sample Questions (Q21-Q26):

### NEW QUESTION # 21

How could you benefit from exporting a SmartConsole object to a CSV file?

- A. You can use it in a script. For example, batch import to a different Quantum Security environment.
- B. To integrate object into Third Party Security Systems such as FortiManager.
- C. To get RADIUS Accounting information based on the utilization of those objects.
- D. For saving the information as inventory information.

**Answer: A**

Explanation:

The correct answer is B. Exporting SmartConsole objects to CSV provides a structured way to review, reuse, document, or

automate object data. In Check Point R82 SmartConsole Help, Object Explorer supports exporting a list of objects to CSV format, and exported CSV files can include objects from Object Explorer. This makes CSV useful for migration, scripting, bulk review, cleanup, or batch operations in another Quantum Security environment. Option A is not the best answer because exporting objects is not specifically designed as a FortiManager integration workflow. Option C is wrong because RADIUS Accounting is an identity/accounting mechanism and is unrelated to exporting SmartConsole objects. Option D is partially plausible because a CSV can be used as inventory evidence, but the exam's strongest technical use case is automation and batch movement of objects across environments. The key point is that Object Explorer export gives administrators portable object data that can be manipulated outside SmartConsole and reused in controlled administrative workflows.

Reference topics: Object Management, Object Explorer, CSV export, SmartConsole object administration.

### NEW QUESTION # 22

What is the role of real-time updates in Application Control and URL Filtering?

- A. They reduce the need for HTTPS Inspection
- B. They encrypt traffic between gateways
- C. They ensure accurate categorization of applications and websites
- D. They manage user authentication

**Answer: C**

Explanation:

The correct answer is A. Application Control and URL Filtering depend on accurate identification and categorization of applications, sites, and URL categories. Real-time or regularly updated classification data helps ensure that new applications, changed SaaS services, new domains, and updated web categories are recognized correctly. Option B is wrong because gateway-to-gateway encryption is VPN

/IPsec functionality, not Application Control or URL Filtering updates. Option C is wrong because user authentication and identity mapping are handled by Identity Awareness sources such as AD Query, Browser-Based Authentication, Identity Collector, RADIUS Accounting, Identity Agents, or Identity Web API. Option D is wrong because updated categorization does not remove the need for HTTPS Inspection; encrypted traffic may still require inspection or metadata-based categorization for accurate enforcement. The core value of updates is classification accuracy, which directly affects policy matching, blocking, allowing, and logging. Reference topics: Application Control, URL Filtering, Application Database, URL categorization, Access Control Policy.

### NEW QUESTION # 23

In the Check Point Security Management Architecture, which component(s) can store logs?

- A. SmartConsole and Security Management Server
- B. SmartConsole
- C. Security Management Server
- D. Security Management Server and Security Gateway

**Answer: D**

Explanation:

The Security Management Server and the Security Gateway are the components that can store logs in the Check Point Security Management Architecture. The Security Management Server stores logs in a database and can also forward them to external log servers. The Security Gateway can store logs locally in a buffer or a local log file, and can also send them to the Security Management Server or a log server.

### NEW QUESTION # 24

What are the advantages of a "shared policy" in R80?

- A. Allows the administrator to install a policy on one Security Gateway and it gets installed on another managed Security Gateway
- B. Allows the administrator to share a policy between all the users identified by the Security Gateway
- C. Allows the administrator to share a policy so that it is available to use in another Policy Package
- D. Allows the administrator to share a policy between all the administrators managing the Security Management Server

**Answer: C**

Explanation:

A shared policy is a set of rules that can be used in multiple policy packages. It allows the administrator to create a common security policy for different gateways or domains, and avoid duplication and inconsistency. The other options are not advantages of a shared policy. [Shared Policies Overview], [Shared Policies Best Practices]

#### NEW QUESTION # 25

What is the correct default permission profile?

- A. Super Permission
- **B. Super User**
- C. Super Profile
- D. Super Admin

**Answer: B**

Explanation:

The correct answer is D. One of the predefined default permission profiles in Check Point Security Management is Super User. In R82 administrator management, permission profiles define what administrators can view, change, publish, install, and manage in SmartConsole and on the Security Management Server. The standard default permission profiles include profiles such as Read Only All, Read Write All, and Super User. Option A, "Super Admin," is a common generic phrase but not the correct Check Point profile name in this question. Options B and C are invented names and are not official default permission profiles. Super User represents the broadest administrative access level and should be assigned carefully. From a best-practice perspective, administrators should generally receive least-privilege permission profiles rather than universal access unless their role truly requires it. This item tests official Check Point terminology, not general security vocabulary. Reference topics:

Administrator Account Management, permission profiles, Super User, SmartConsole administrator permissions.

#### NEW QUESTION # 26

.....

TestPassed is a website specifically provide the certification exam information sources for CheckPoint professionals. Through many reflects from people who have purchase TestPassed's products, TestPassed is proved to be the best website to provide the source of information about 156-215.82 Certification Exam. The product of 156-215.82 is a very reliable training tool for you. The answers of the exam exercises provided by TestPassed is very accurate. Our TestPassed's senior experts are continuing to enhance the quality of our training materials.
