### Pure Storage Certified FlashArray Implementation Specialist Sample Questions (Q109-Q114):

#### NEW QUESTION # 109

When using FA File, where can the Implementation Engineer manage directories?

- A. Storage > File Systems
- B. Analytics > Performance > Directories
- C. Settings > Access > Directory Services

**Answer: A**

Explanation:

In the Purity//FA Graphical User Interface (GUI), the management of FA File resources is integrated into the core "Storage" navigation pane. To manage specific file system directories-such as creating new exports, setting quotas, or managing directory-level policies-the Implementation Engineer must navigate to Storage > File Systems .

Within this view, the engineer can see the list of provisioned file systems. By clicking into a specific file system, they can access the "Directories" sub-tab or detailed view where folders (directories) within that file system can be explicitly managed.

It is important not to confuse this with "Directory Services," which is located under the Settings menu.

"Directory Services" (Option B) refers to the configuration of Active Directory (AD) or LDAP connections for user authentication and identity mapping, not the management of the actual file storage structure.

Similarly, the Analytics tab (Option C) provides performance metrics but does not offer configuration capabilities for creating or modifying directories.

#### NEW QUESTION # 110

Support requests a powercycle on a newly-installed FlashArray. What is the correct way to perform this action?

- A. Push the power button on each controller.
- B. Unplug the cable on each power supply.
- C. Run purearray reboot.

**Answer: C**

Explanation:

To perform a "powercycle" or restart of the FlashArray system as typically requested by Support for diagnostic or initialization purposes, the correct and safe method is to run the purearray reboot command.

While the term "power cycle" often implies a physical interruption of power in general IT terminology, Pure Storage FlashArrays are designed as "Always-On" systems and do not have standard physical power buttons on the controllers for this purpose (Option A is incorrect as no such button exists for system-wide power cycling). Physically unplugging the power cables (Option B) constitutes a "hard" power cycle or "cold boot," which is generally reserved for specific hardware replacements or emergency procedures, not standard support requests on a healthy or newly installed system.

The purearray reboot command gracefully shuts down the Purity operating system services, flushes data from the volatile memory to the non-volatile storage, and restarts both controllers sequentially or simultaneously depending on the arguments. This ensures that the system returns to a clean state without the risk of data inconsistency or "dirty" shutdowns that physical cable removal might cause. In the context of a new installation or support troubleshooting, this software-driven restart is the standard procedure.

#### NEW QUESTION # 111

What is the maximum number of SAS shelves supported for FlashArray//XL?

- A. 0
- B. 1
- C. 2

**Answer: B**

Explanation:

The FlashArray//XL supports up to two DirectFlash Shelves (DFS) for capacity expansion. This configuration allows for scalable storage solutions while maintaining optimal performance and efficiency. Each shelf can be connected to the array using appropriate interfaces, ensuring seamless integration and data flow. This setup is particularly beneficial for environments requiring high throughput and low latency, such as large-scale databases and enterprise applications.

#### NEW QUESTION # 112

During a hardware NDU from FlashArray//XR2 or XR3 to an XR4 model, which default service on-board ports are NO longer present in the XR4 controller design?

- A. Management
- B. iSCSI
- C. Replication

**Answer: B**

Explanation:

In the architectural evolution from FlashArray//XR2 and //XR3 to the FlashArray//XR4, Pure Storage made significant changes to the controller's rear panel and I/O design to accommodate higher performance and PCIe Gen 4 capabilities. One of the most critical changes for an Implementation Engineer to plan for during a hardware Non-Disruptive Upgrade (NDU) is the removal of the onboard, default iSCSI ports that were present on previous generations.

On //XR2 and //XR3 controllers, there were onboard Ethernet ports often used for iSCSI host connectivity without requiring a discrete PCIe adapter. However, the //XR4 controller design removes these dedicated onboard iSCSI ports to streamline the motherboard design and shift host I/O strictly to PCIe add-in cards. The

//XR4 retains onboard ports specifically for Management (Mgmt) and Replication connectivity, ensuring that administrative access and array-to-array replication can still be maintained without additional hardware.

Consequently, if a customer was relying solely on the onboard ports for iSCSI traffic on their legacy //XR2 or //XR3, the Bill of Materials (BOM) for the upgrade to //XR4 must include discrete Ethernet/iSCSI PCIe cards to migrate those connections. Failure to identify this architectural difference during the pre-upgrade inventory can result in a loss of host connectivity or an inability to cable the new controllers correctly, as the expected physical ports simply will not exist on the new chassis.

### NEW QUESTION # 113

At the completion of an upgrade, which command is used to send phonehome logs?

- A. purearray phonehome --send-today
- B. purelogs --send-all
- C. purearray phonehome --send-logs

**Answer: A**
