CDPSE Free Download - ISACA First-grade Reliable CDPSE Practice Questions

With the help of our ISACA CDPSE practice materials, you can successfully pass the actual exam with might redoubled. Our company owns the most popular reputation in this field by providing not only the best ever ISACA CDPSE Study Guide but also the most efficient customers' servers.

The CDPSE certification exam is comprised of four domains: Data Privacy Governance, Data Privacy Architecture, Data Privacy Operations, and Data Privacy Solutions. Each domain covers specific knowledge areas that are essential for professionals working in the field of data privacy. CDPSE exam is designed to test candidates' knowledge in each of these domains and validate their ability to apply this knowledge in real-world scenarios.

ISACA CDPSE (Certified Data Privacy Solutions Engineer) Exam is a certification program that equips professionals with the knowledge and skills necessary to design and implement data privacy solutions. Certified Data Privacy Solutions Engineer certification is globally recognized and signifies that the holder is capable of driving effective data privacy solutions in organizations. The CDPSE Exam covers topics such as data privacy governance, data protection, data retention, and data disposal. CDPSE exam is designed to test the candidate's ability to analyze and mitigate privacy risks, create and implement privacy policies and procedures, and monitor and report on privacy compliance.

ISACA Certified Data Privacy Solutions Engineer Sample Questions (Q190-Q195):

NEW QUESTION # 190

Which of the following is the BEST method to ensure the security of encryption keys when transferring data containing personal information between cloud applications?

- A. Whole disk encryption
- **B. Asymmetric encryption**
- C. Symmetric encryption
- D. Digital signature

Answer: B

Explanation:

Asymmetric encryption is a method of encrypting and decrypting data using two different keys: a public key and a private key. The public key can be shared with anyone, while the private key is kept secret by the owner. Data encrypted with the public key can only be decrypted with the private key, and vice versa. Asymmetric encryption ensures the security of encryption keys when transferring data containing personal information between cloud applications, by providing the following benefits:

It can prevent unauthorized access or use of the data, as only the intended recipient who has the matching private key can decrypt the data sent by the sender who has the public key.

It can prevent man-in-the-middle attacks, where an attacker intercepts and modifies the data or keys in transit, as any tampering with the data or keys will result in decryption failure or error.

It can enable digital signatures, where the sender encrypts a message digest of the data with their private key, and the recipient verifies it with the sender's public key. Digital signatures can ensure the authenticity and integrity of the data and the sender.

The other options are less effective or irrelevant for ensuring the security of encryption keys when transferring data containing personal information between cloud applications. Whole disk encryption is a method of encrypting all the data on a disk or device, such as a laptop or a smartphone. It does not protect the data when they are transferred over a network or stored on a cloud server. Symmetric encryption is a method of encrypting and decrypting data using the same key. It requires both parties to securely exchange and store the key, which may be difficult or risky in a cloud environment. Digital signature is not a method of encryption, but an application of asymmetric encryption that can provide additional security features for data transmission.

NEW QUESTION # 191

Which of the following is the MOST important consideration when writing an organization's privacy policy?

- A. Including a development plan for personal data handling
- B. Ensuring acknowledgment by the organization's employees
- **C. Aligning statements to organizational practices**
- D. Using a standardized business taxonomy

Answer: C

Explanation:

The most important consideration when writing an organization's privacy policy is to align the statements to the organizational practices, because this will help ensure that the policy is accurate, consistent, and transparent. A privacy policy is a document that explains how the organization collects, uses, discloses, and protects personal data from its customers, employees, partners, and other stakeholders. A privacy policy should reflect the actual data processing activities and privacy measures of the organization, as well as comply with the applicable laws and regulations. A privacy policy that is not aligned with the organizational practices may lead to confusion, mistrust, or legal liability¹².

NEW QUESTION # 192

Which of the following is a foundational goal of data privacy laws?

- A. Privacy laws are designed to provide transparency for the collection of personal data
- B. Privacy laws are designed to protect companies' collection of personal data
- **C. Privacy laws are designed to give people rights over the collection of personal data**
- D. Privacy laws are designed to prevent the collection of personal data

Answer: C

Explanation:

Explanation

One of the foundational goals of data privacy laws is to give people rights over the collection of personal data, such as the right to access, correct, delete, or object to the processing of their data. Privacy laws also aim to protect people's dignity, autonomy, and self-determination in relation to their personal data. The other options are not accurate or complete descriptions of the purpose of data privacy laws.

NEW QUESTION # 193

As part of a major data discovery initiative to identify personal data across the organization, the project team has identified the proliferation of personal data held as unstructured data as a major risk. What should be done FIRST to address this situation?

- A. Identify who has access to sensitive unstructured data.
- B. Assign an owner to sensitive unstructured data.
- **C. Classify sensitive unstructured data.**
- D. Identify sensitive unstructured data at the point of creation.

Answer: C

Explanation:

Classifying sensitive unstructured data should be done first to address the situation of the proliferation of personal data held as unstructured data, as it helps to identify the types, locations, and owners of the data, and to apply the appropriate privacy controls and measures based on the data classification level. Classifying sensitive unstructured data also facilitates the data discovery, data minimization, data retention, and data disposal processes. Reference: 2 Domain 3, Task 2; 5 Page 9

NEW QUESTION # 194

An organization is concerned with authorized individuals accessing sensitive personal customer information to use for unauthorized purposes. Which of the following technologies is the BEST choice to mitigate this risk?

- A. User behavior analytics
- B. Email filtering system
- C. Intrusion monitoring
- D. Mobile device management (MDM)

Answer: A

Explanation:

User behavior analytics is a technology that uses data analysis and machine learning to monitor, detect and respond to anomalous or malicious user activities, such as accessing sensitive personal customer information to use for unauthorized purposes. User behavior analytics is the best choice to mitigate this risk, as it would help to identify and prevent insider threats, data breaches, fraud or misuse of data by authorized individuals. User behavior analytics can also help to enforce policies and controls, such as access control, audit trail or data loss prevention. The other options are not as effective as user behavior analytics in mitigating this risk. Email filtering system is a technology that scans and blocks incoming or outgoing emails that contain spam, malware or phishing attempts, but it does not address the issue of authorized individuals accessing sensitive personal customer information to use for unauthorized purposes. Intrusion monitoring is a technology that monitors and alerts on unauthorized or malicious attempts to access a system or network, but it does not address the issue of authorized individuals accessing sensitive personal customer information to use for unauthorized purposes. Mobile device management (MDM) is a technology that manages and secures mobile devices that are used to access or store organizational data, but it does not address the issue of authorized individuals accessing sensitive personal customer information to use for unauthorized purposes. 1, p. 92 Reference: 1: CDPSE Review Manual (Digital Version)
