Reliable Nutanix NCP-MCA Test Voucher - Interactive NCP-MCA EBook

The Nutanix NCP-MCA online exam is the best way to prepare for the Nutanix NCP-MCA exam. Exam-Killer has a huge selection of NCP-MCA dumps and topics that you can choose from. The NCP-MCA Exam Questions are categorized into specific areas, letting you focus on the Nutanix NCP-MCA subject areas you need to work on.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q48-Q53):

NEW QUESTION # 48

An administrator has an existing set of VMs that were deployed before the company started using Calm. The administrator would like to now use Calm to manage those existing VMs.

What should the administrator do to manage the existing VMs?

- A. Create a Brownfield Application, select the VMs that are needed for each deployment from the drop down list.
- B. Create a Greenfield Application, select the snapshots of the VMs to manage and redeploy the VMs from the latest snapshot.
- C. Create a Brownfield Application, select the snapshots of the VMs to manage and redeploy the VMs from the latest snapshot.
- D. Create a Greenfield Application, select the VMs that are needed for each deployment from the drop down list.

Answer: C

NEW QUESTION # 49

Refer to the exhibit.

The screenshot shows the Nutanix alert configuration interface. On the left, there is a vertical menu with 'Alert' selected. Below it are 'Actions' and three action items: 'VM Snapshot', 'VM Add Memory', and 'Email'. On the right, the alert details are shown: 'Alert Policy' is 'VM {vm_name} Memory Constrained', 'Severity' is 'Info', and 'Target Entities' is 'VM'. The Nutanix logo is at the top left.

The VM appSAP01 dev is a SAP development environment application and it is common to have memory constrained alerts on this VM, but the administrator wants to avoid adding memory to development VMs like this one, since this is normally done for only production VMs.

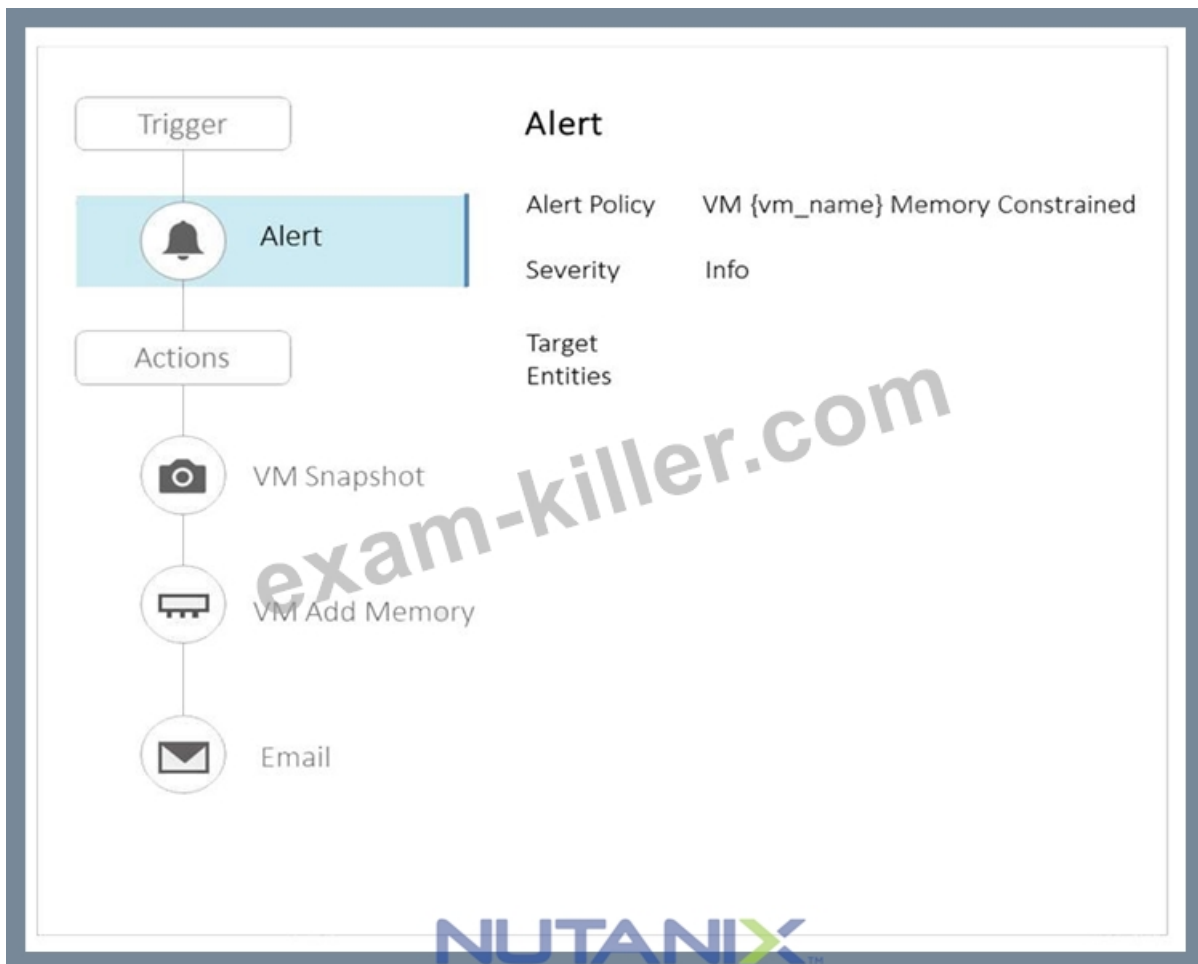

Which two actions should the administrator take to avoid adding memory to the development VMs? (Choose two.)

- A. Modify the Alert by adding the correct category
- B. Assign the category Environment:Development to development VMs
- C. Disable the Alert in Prism Central
- D. Assign the category Environment:Production to the production VMs

Answer: A,B

NEW QUESTION # 50

Refer to the exhibit.

The VM appSAP01 dev is a SAP development environment application and it is common to have memory constrained alerts on this VM, but the administrator wants to avoid adding memory to development VMs like this one, since this is normally done for only production VMs.

Which two actions should the administrator take to avoid adding memory to the development VMs? (Choose two.)

- A. Modify the Alert by adding the correct category
- B. Assign the category Environment:Development to development VMs
- C. Disable the Alert in Prism Central
- D. Assign the category Environment:Production to the production VMs

Answer: A,B

Explanation:

The administrator should modify the alert by adding the correct category and assign the category Environment:Development to development VMs. By doing this, they can filter out alerts for development VMs that are expected to have memory constrained alerts and focus on those that are critical, such as production VMs. This is based on the general practices in managing alerts in a multicloud environment, as well as the specific features and requirements of Nutanix Calm and Prism Central. Reference: How to create custom alert policies | Prism central | Nutanix Community Nutanix Certified Professional - Multicloud Automation (NCP-MCA) v6.5 Exam Blueprint Guide, Section 3: Validate Blueprints, Runbooks, Playbooks, and Automation Settings, Objective 3.1: Determine the causes of a Blueprint or Runbook deployment failure Nutanix Multicloud Automation Administration (NMCAA) course, Module 4: Nutanix Calm Governance, Lesson 1: Nutanix Calm Governance

NEW QUESTION # 51

A company has a business-critical VM. The VM Utilization of CPU and memory differs from time to time, but can never be allowed to run out of resources. The administrator also wants to make sure that the VM is not over provisioned when not needed.

The administrator determines these requirements that have been validated and automated in a test environment should also apply for the production environment:

VCPUs need to be added when CPU Utilization been over 80% for 15 minutes.

Memory needs to be increased by 4 GB when utilization reaches 80%.

Return of over-allocated resources must not affect other business applications.

What can the administrator do with the least amount of effort to make sure the VM is always performant and returns resources when not required?

- A. Import the playbook and adjust the values
- B. Create a blueprint based on requirements
- C. Clone and adjust the system-created playbooks
- **D. Create a task based on requirements**

Answer: D

NEW QUESTION # 52

An administrator is tasked with creating a blueprint in Self-Service to deploy a multi-tier web application consisting of a front-end web server, a backend application server, and a database. The blueprint should allow end users to deploy the full stack with a single action.

Which step should the administrator take to ensure the blueprint supports this requirement?

- A. Request users to upload ISO files and install each service manually after blueprint deployment.
- **B. Add all server tiers as separate services within a Multi-VM blueprint, define dependencies, and publish it to a Self-Service project.**
- C. Use image services to manually create and deploy the VMs, then import them to a blueprint.
- D. Create individual blueprints for each server tier and publish them separately as Marketplace items for users to deploy manually.

Answer: B

Explanation:

Nutanix Self-Service (Calm) is designed to model complex applications using Multi-VM Blueprints.

To support a multi-tier stack (Web, App, DB) deployable in a single action:

* Multiple Services: The administrator defines three distinct Services within the blueprint editor, one for each tier.

* Dependencies: The administrator defines boot dependencies (e.g., Database must be up before App Server; App Server must be up before Web Server).

* Single Action: Once published to the Project, the end-user sees a single catalog item. Clicking "Launch" triggers the orchestration engine to provision all VMs and configure them in the correct order automatically.

NEW QUESTION # 53

.....

Only to find ways to success, do not make excuses for failure. To pass the Nutanix NCP-MCA Exam, in fact, is not so difficult, the key is what method you use. Exam-Killer's Nutanix NCP-MCA exam training materials is a good choice. It will help us to pass the exam successfully. This is the best shortcut to success. Everyone has the potential to succeed, the key is what kind of choice you have.
