We have three versions for your practice according to your study habit. The pdf version is for you to print the MuleSoft-Integration-Architect-I Dump pdf out and you can share your MuleSoft-Integration-Architect-I exam dumps with your friends and classmates. The test engine version enables you feeling the atmosphere of formal test because it is a simulation of real test. The soft version is same as the test engine but it allows you to practice your Salesforce MuleSoft real dumps in any electronic equipment.

Salesforce MuleSoft-Integration-Architect-I Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Designing Automated Tests for Mule Applications: This topic covers unit test suites, and scenarios for integration and performance testing.
Topic 2	<ul style="list-style-type: none"> Applying DevOps Practices and Operating Integration Solutions: Its sub-topics are related to designing CI CD pipelines with MuleSoft plugins, automating interactions with Anypoint Platform, designing logging configurations, and identifying Anypoint Monitoring features.
Topic 3	<ul style="list-style-type: none"> Designing Integration Solutions to Meet Persistence Requirements: It addresses the usage of VM queues and connectors, object stores and services, and stateful components configured with object stores.
Topic 4	<ul style="list-style-type: none"> Initiating Integration Solutions on Anypoint Platform: Summarizing MuleSoft Catalyst and Catalyst Knowledge Hub, differentiating between functional and non-functional requirements, selecting features for designing and managing APIs, and choosing deployment options are its sub-topics.
Topic 5	<ul style="list-style-type: none"> Designing Integration Solutions to Meet Reliability Requirements: It includes selecting alternatives to traditional transactions, recognizing the purpose of various scopes and strategies, differentiating disaster recovery and high availability, and using local and XA transactions.

Our MuleSoft-Integration-Architect-I practice materials are your optimum choices which contain essential know-hows for your information. If you really want to get the certificate successfully, only MuleSoft-Integration-Architect-I practice materials with intrinsic contents can offer help they are preeminent materials can satisfy your both needs of studying or passing with efficiency. You may strand on some issues at sometimes, all confusions will be answered by their bountiful contents. Wrong choices may engender wrong feed-backs, we are sure you will come a long way by our MuleSoft-Integration-Architect-I practice material.

Salesforce Certified MuleSoft Integration Architect I Sample Questions (Q194-Q199):

NEW QUESTION # 194

A leading eCommerce giant will use MuleSoft APIs on Runtime Fabric (RTF) to process customer orders.

Some customer-sensitive information, such as credit card information, is required in request payloads or is included in response payloads in some of the APIs. Other API requests and responses are not authorized to access some of this customer-sensitive information but have been implemented to validate and transform based on the structure and format of this customer-sensitive information (such as account IDs, phone numbers, and postal codes).

What approach configures an API gateway to hide sensitive data exchanged between API consumers and API implementations, but can convert tokenized fields back to their original value for other API requests or responses, without having to recode the API implementations?

Later, the project team requires all API specifications to be augmented with an additional non-functional requirement (NFR) to protect the backend services from a high rate of requests, according to defined service-level agreements (SLAs). The NFR's SLAs are based on a new tiered subscription level "Gold", "Silver", or

"Platinum" that must be tied to a new parameter that is being added to the Accounts object in their enterprise data model.

Following MuleSoft's recommended best practices, how should the project team now convey the necessary non-functional requirement to stakeholders?

- A. Create and deploy API proxies in API Manager for the NFR, change the baseUrl in each API specification to the corresponding API proxy implementation endpoint, and publish each modified API specification to Exchange
- B. Create a shared RAML fragment required to implement the NFR, list each API implementation endpoint in the RAML fragment, and publish the RAML fragment to Exchange
- C. Update each API specification with comments about the NFR's SLAs and publish each modified API specification to Exchange
- **D. Update each API specification with a shared RAML fragment required to implement the NFR and publish the RAML fragment and each modified API specification to Exchange**

Answer: D

Explanation:

To convey the necessary non-functional requirement (NFR) related to protecting backend services from a high rate of requests according to SLAs, the following steps should be taken:

* Create a Shared RAML Fragment: Develop a RAML fragment that defines the NFR, including the SLAs for different subscription levels ("Gold", "Silver", "Platinum"). This fragment should include the details on rate limiting and throttling based on the new parameter added to the Accounts object.

* Update API Specifications: Integrate the shared RAML fragment into each API specification. This ensures that the NFR is consistently applied across all relevant APIs.

* Publish to Exchange: Publish the updated API specifications and the shared RAML fragment to Anypoint Exchange. This makes the NFR visible and accessible to all stakeholders and developers, ensuring compliance and implementation consistency.

This approach ensures that the NFR is clearly communicated and applied uniformly across all API implementations.

NEW QUESTION # 195

As part of a growth strategy, a supplier signs a trading agreement with a large customer. The customer sends purchase orders to the supplier according to the ANSI X12 EDI standard, and the supplier creates the orders in its ERP system using the information in the EDI document.

The agreement also requires that the supplier provide a new RESTful API to process request from the customer for current product inventory level from the supplier's ERP system.

Which two fundamental integration use cases does the supplier need to deliver to provide an end-to-end solution for this business scenario? (Choose two.)

- A. Synchronized data transfer
- B. Sharing data with external partners
- C. Data mashups
- D. Streaming data ingestion
- E. User interface integration

Answer: A,B

Explanation:

In this business scenario, the supplier needs to deliver two fundamental integration use cases to provide an end-to-end solution:

A: Synchronized data transfer: This involves ensuring that the customer's purchase orders (sent using ANSI X12 EDI standard) are accurately and timely transferred and reflected in the supplier's ERP system. This synchronization ensures data consistency between the EDI transactions and the ERP system.

B: Sharing data with external partners: This involves providing the customer with a RESTful API to access current product inventory levels from the supplier's ERP system. Sharing data through a RESTful API allows the customer to retrieve up-to-date inventory information as needed.

NEW QUESTION # 196

An organization is not meeting its growth and innovation objectives because IT cannot deliver projects fast enough to keep up with the pace of change required by the business.

According to MuleSoft's IT delivery and operating model, which step should the organization take to solve this problem?

- A. Adopt a new approach that decouples core IT projects from the innovation that happens within each line of business
- B. Switch from a design-first to a code-first approach for IT development
- C. Modify IT governance and security controls so that line of business developers can have direct access to the organization's systems of record
- D. Hire more IT developers, architects, and project managers to increase IT delivery

Answer: A

NEW QUESTION # 197

An architect is designing a Mule application to meet the following two requirements:

1. The application must process files asynchronously and reliably from an FTPS server to a back-end database using VM intermediary queues for load-balancing Mule events.

2. The application must process a medium rate of records from a source to a target system using a Batch Job scope.

To make the Mule application more reliable, the Mule application will be deployed to two CloudHub 1.0 workers.

Following MuleSoft-recommended best practices, how should the Mule application deployment typically be configured in Runtime Manager to best support the performance and reliability goals of both the Batch Job scope and the file processing VM queues?

- A. In the Runtime Manager Properties tab, enable persistent VM queues for the FTPS connector
- B. Check the Non-persistent VM queues checkbox in the application deployment configuration
- C. In the Runtime Manager Properties tab, disable persistent VM queues for Batch Job scopes
- D. Check the Persistent VM queues checkbox in the application deployment configuration

Answer: D

Explanation:

* Requirements:

* Asynchronous and Reliable File Processing: The application must process files from an FTPS server to a back-end database using VM intermediary queues for load balancing.

* Batch Job Processing: The application must process records from a source to a target system using a Batch Job scope.

* Persistent VM Queues:

* Reliability: Persistent VM queues ensure that messages are not lost even if there is a system failure or restart. This is critical for reliable file processing and load balancing.

* Asynchronous Processing: Persistent queues allow for asynchronous processing, where messages can be stored and processed independently of the producer and consumer lifecycles.

* MuleSoft Best Practices:

* Persistent VM Queues for Load Balancing: Using persistent VM queues aligns with MuleSoft best practices for ensuring reliable message processing and load balancing between Mule events.

* High Availability: With CloudHub 1.0 workers, enabling persistent VM queues helps maintain high availability and reliability of the application.

* Batch Job Scope: Ensuring persistence for VM queues also benefits batch processing by maintaining consistency and ensuring all records are processed even in the event of disruptions.

* Configuration in Runtime Manager:

* Deployment Configuration: When deploying the Mule application in Runtime Manager, check the "Persistent VM queues" checkbox to enable this feature.

* Impact: This configuration ensures that the application meets its performance and reliability goals by safeguarding the integrity and continuity of the processing tasks.

NEW QUESTION # 198

An API has been unit tested and is ready for integration testing. The API is governed by a Client ID Enforcement policy in all environments.

What must the testing team do before they can start integration testing the API in the Staging environment?

- A. They must request access to the API instance in the Staging environment and obtain a Client ID and Client Secret to be used for testing the API
- B. They must access the API portal and create an API notebook using the Client ID and Client Secret supplied by the API portal in the Staging environment
- C. They must be assigned as an API version owner of the API in the Staging environment
- D. They must request access to the Staging environment and obtain the Client ID and Client Secret for that environment to be used for testing the API

Answer: A

Explanation:

* It's mentioned that the API is governed by a Client ID Enforcement policy in all environments.

* Client ID Enforcement policy allows only authorized applications to access the deployed API implementation.

* Each authorized application is configured with credentials: client_id and client_secret.

* At runtime, authorized applications provide the credentials with each request to the API implementation.
