

2026 IT Specialist Trustable INF-306: Reliable HTML5 Application Development Dumps Ebook

As a brand in the field, our INF-306 exam questions are famous for their different and effective advantages. Our professional experts have developed our INF-306 study materials to the best. So if you buy them, you will find that our INF-306 learning braindumps are simply unmatched in their utility and perfection. Our huge clientele is immensely satisfied with our product and the excellent passing rate of our INF-306 simulating exam is the best evidence on it.

New questions will be added into the study materials, unnecessary questions will be deleted from the INF-306 exam simulation. Our new compilation will make sure that you can have the greatest chance to pass the exam. If you compare our INF-306 training engine with the real exam, you will find that our study materials are highly similar to the real exam questions. So you just need to memorize our questions and answers of the INF-306 Exam simulation, you are bound to pass the exam.

IT Specialist INF-306 Pass Guaranteed, New INF-306 Test Review

Improve Your Profession With INF-306 Questions. HTML5 Application Development Questions – Best Strategy for Instant Preparation. To achieve these career objectives, you must pass the HTML5 Application Development examination. Are you ready to prepare for the challenging INF-306test? Are you looking for the best IT Specialist Exam practice material? If your answer is yes, then you should rely on PDFDumps and get INF-306 Real Exam Questions. Download these actual INF-306 Exam Dumps and start your journey.

IT Specialist HTML5 Application Development Sample Questions (Q50-Q55):

NEW QUESTION # 50

You need to implement media queries for the responsive layout of a new website. Low-resolution wireframes for the desktop, tablet, and mobile layouts are shown.

Answer Area

What is the correct media query for the desktop layout?

- @media only screen and (min-width : 285px) and (max-width : 480px)
- @media only screen and (min-width : 481px) and (max-width : 1024px)
- @media only screen and (max-width:1025px) and (min-width: 1920px)
- @media only screen and (min-width:1025px)

What is the correct media query for the tablet layout?

- @media only screen and (min-width : 285px) and (max-width : 480px)
- @media only screen and (min-width : 481px) and (max-width : 1024px)
- @media only screen and (max-width:1025px) and (min-width: 1920px)
- @media only screen and (min-width:1025px)

What is the correct media query for the mobile layout?

- @media only screen and (min-width : 285px) and (max-width : 480px)
- @media only screen and (min-width : 481px) and (max-width : 1024px)
- @media only screen and (max-width:1025px) and (min-width: 1920px)
- @media only screen and (min-width:1025px)

Answer:

Explanation:

Answer Area

What is the correct media query for the desktop layout?

- @media only screen and (min-width : 285px) and (max-width : 480px)
- @media only screen and (min-width : 481px) and (max-width : 1024px)
- @media only screen and (max-width:1025px) and (min-width: 1920px)
- @media only screen and (min-width:1025px)

What is the correct media query for the tablet layout?

- @media only screen and (min-width : 285px) and (max-width : 480px)
- @media only screen and (min-width : 481px) and (max-width : 1024px)
- @media only screen and (max-width:1025px) and (min-width: 1920px)
- @media only screen and (min-width:1025px)

What is the correct media query for the mobile layout?

- @media only screen and (min-width : 285px) and (max-width : 480px)
- @media only screen and (min-width : 481px) and (max-width : 1024px)
- @media only screen and (max-width:1025px) and (min-width: 1920px)
- @media only screen and (min-width:1025px)

Explanation:

Layout	Correct Media Query
Desktop layout	@media only screen and (min-width: 1025px)
Tablet layout	@media only screen and (min-width: 481px) and (max-width: 1024px)
Mobile layout	@media only screen and (min-width: 285px) and (max-width: 480px)

Responsive layouts use CSS media queries to apply different style rules according to the viewport width or device characteristics. In this scenario, the three wireframes represent desktop, tablet, and mobile breakpoints.

The desktop layout should use `@media only screen and (min-width: 1025px)` because desktop screens are the widest target group and begin above the tablet maximum width. The tablet layout should use `@media only screen and (min-width: 481px) and (max-width: 1024px)` because it covers the middle range between mobile and desktop. The mobile layout should use `@media only screen and (min-width: 285px) and (max-width:`

`480px)` because it targets the smallest viewport range shown in the available choices. The option `@media only screen and (max-width: 1025px) and (min-width: 1920px)` is logically invalid because a viewport cannot simultaneously be at least 1920 pixels wide and no more than 1025 pixels wide. References/topics: responsive web design, CSS media queries, viewport breakpoints, mobile layout, tablet layout, desktop layout.

NEW QUESTION # 51

The following form is missing validation attributes:

```
< form >
< div class= " container " >
< h1 > Register Here < /h1 >
< p > Please fill in the details to create an account with us. < /p >
< hr >
< label for= " ? " > < b > Enter Email < /b > < /label >
< input type= " ? " placeholder= " Enter Email " name= " ? " placeholder= " username@domain.com " >
< label for= " ? " > < b > Password < /b > < /label >
< input type= " ? " placeholder= " Enter Password " name= " ? " >
< label for= " ? " > < b > Confirm Password < /b > < /label >
< input type= " ? " placeholder= " Confirm Password " name= " ? " >
< label for= " phone " > < b > Phone < /b > < /label >
< input type= " tel " id= " phone " name= " phone " placeholder= " 123-45-678 " >
< hr >
< p > By creating an account you agree to our < a href= " # " > Terms & Privacy < /a > . < /p >
< button type= " submit " class= " registerbtn " > < strong > Register < /strong > < /button >
< /div >
< /form >
```

You need to update the form to enforce the following requirements for visitors:

- * All fields must be completed with valid information.
- * The users should not be allowed to type passwords longer than 8 characters.
- * Passwords must use only numbers and letters.
- * Phone numbers and email addresses must follow the configuration of the placeholder text.
- * The browser must display an error message that makes it clear what type of input change is needed.

Review the markup on the left.

Complete the sentences by selecting the correct option from each drop-down list.

Note: You will receive partial credit for each correct selection.

The required attribute is needed for of the input elements.

- one
- two
- three
- four

The password and phone fields require attributes.

- max
- maxlength
- min and max
- minlength and maxlength

A completed pattern attribute is needed for the fields.

- email
- password
- phone
- password and phone
- email, password, and phone

Answer:

Explanation:

The required attribute is needed for of the input elements.

one
two
three
four

The password and phone fields require attributes.

max
maxlength
min and max
minlength and maxlength

A completed pattern attribute is needed for the fields.

email
password
phone
password and phone
email, password, and phone

Dumps

Explanation:

First drop-down: four

Second drop-down: maxlength

Third drop-down: email, password, and phone

The form contains four user-entry input elements: email, password, confirm password, and phone. Since the requirements state that all fields must be completed, the required attribute must be applied to all four inputs.

The password field must prevent entries longer than eight characters, so the correct length-control attribute is maxlength, not max; max applies to numeric/date-style value ranges, while maxlength limits character count in text-style inputs. The phone field also benefits from maxlength because its placeholder format has a fixed visible structure. Finally, completed pattern attributes are needed for email, password, and phone because each has a required format rule: the email must match the placeholder-style address format, the password must use only letters and numbers, and the phone number must follow the placeholder format such as 123-45-678. The title attribute should accompany these patterns to produce meaningful browser validation messages.

NEW QUESTION # 52

You create an interface for a touch-enabled application. Some input buttons do not trigger when tapped. What are two possible causes?

- A. The defined input areas are not large enough.
- B. The input areas are using event handlers to detect input.
- C. The input areas overlap with other input areas.
- D. The touch screen is not initialized.

Answer: A,C

Explanation:

The correct causes are insufficient input target size and overlapping input areas. Touch interaction depends on hit testing: the browser or platform determines which element occupies the touched screen coordinate and dispatches the event to that element. If a button's active area is too small, the user's finger may visually appear to tap the button while the actual touch coordinate falls outside the actionable target. Microsoft's touch- target guidance recommends touch targets around 7.5 mm square, approximately 40 × 40 pixels on a 135 PPI display, to support reliable activation. Overlap is also a valid cause because one element can partially cover or compete with another during hit testing; W3C target-size guidance notes that overlapping areas should not be counted as usable target area unless the overlapping controls perform the same action. Event handlers are not the problem by themselves; they are the standard mechanism for detecting user input. "Touch screen not initialized" is not a normal HTML5 application-level cause. References/topics: touch input, event handling, hit testing, target size, overlapping controls.

NEW QUESTION # 53

You want to display a message box showing the user 's current latitude and longitude as identified by the user' s browser. Complete the code by selecting the correct option from each drop-down list.

Note: You will receive partial credit for each correct selection.

```
if (  ){  
      
      
     .   
      
      
      
      
      
      
      
}  
function showLocation(position) {  
    alert(position.coords.latitude + "," + position.coords.longitude);  
}
```

Answer:

Explanation:

```

if ( [ ] ){
  navigator.geolocation
  window.location

  [ ] . [ ]
  showLocation
  navigator.geolocation
  window.location
  getCurrentPosition(showLocation)
  getCurrentPosition(window.location)
  showLocation(navigator.geolocation)
  showLocation(window.location)
}
function showLocation(position) {
  alert(position.coords.latitude + "," + position.coords.longitude);
}

```

Explanation:

First drop-down: navigator.geolocation

Second drop-down: navigator.geolocation

Third drop-down: getCurrentPosition(showLocation)

The correct API object is navigator.geolocation because browser-based geographic location is exposed through the Geolocation API, not through window.location. window.location represents the current page URL and navigation state; it does not provide latitude or longitude. The first selection checks whether the browser supports geolocation by evaluating navigator.geolocation. Inside the block, the same object must be used to request the user's current position. The correct method is getCurrentPosition(showLocation), which requests the device's current location and passes a position object to the callback function when the location is available. The callback then reads position.coords.latitude and position.coords.longitude and displays those values with alert(). The alternatives that pass window.location are incorrect because they provide page- location information rather than geographic coordinates. The alternatives that call showLocation(...) directly are also incorrect because the browser must first retrieve the actual position object. References/topics:

Geolocation API, navigator.geolocation, getCurrentPosition(), callback functions, latitude and longitude.

NEW QUESTION # 54

Which element should you use to rotate an SVG square?

- A. path
- B. animateTransform
- C. animateMotion
- D. circle

Answer: B

Explanation:

The correct element is animateTransform. In SVG, rotation is not produced by drawing a different shape; it is produced by applying a transformation to an existing graphical element, such as a < rect > representing a square. The < animateTransform > element is specifically designed to animate the transform attribute of a target SVG element, and its supported transformation types include translation, scaling, rotation, and skewing.

Therefore, to rotate a square, the square would normally be defined with a shape element such as < rect > , and an < animateTransform > child or associated animation would specify attributeName= " transform " and type= " rotate " . animateMotion is incorrect because it moves an element along a motion path rather than rotating the element itself. circle is a shape element, not an animation mechanism. path defines arbitrary vector geometry, but it does not by itself animate or rotate another object.

References/topics: SVG graphics, SVG transformations, animation elements, transform attribute, rotation animation.
