UiPath Automation Business Analyst Associate Exam (2023.10) Sample Questions (Q80-Q85):

NEW QUESTION # 80

Which of the following best describes the main benefit of documenting an organized lifecycle for automation projects?

- A. Delays in testing and review
- B. **Consistent quality, faster turnaround, and successful implementations**
- C. Increased need for manual approval
- D. Reduces the need for communication among teams

Answer: B

Explanation:

Documenting and following an organized lifecycle for automation projects - as outlined in the UiPath Automation Implementation Methodology - leads to consistent quality, faster turnaround times, and more successful implementations.

Each stage in the lifecycle - from Kickoff to Project Closure - has defined roles, responsibilities, deliverables, and checkpoints. This structured approach helps teams stay aligned, reduces misunderstandings, enables better risk management, and ensures that issues are caught early.

With a clear lifecycle, automation projects become repeatable, scalable, and manageable, even as the number of automated processes grows. This approach supports long-term success and helps organizations build sustainable automation programs with measurable value.

NEW QUESTION # 81

Which of the following stages comes immediately after the Process Analysis stage?

- A. **Solution Design**
- B. Business Case and Technical Validation
- C. User Acceptance Testing
- D. Development and Testing

Answer: A

Explanation:

After the Process Analysis stage, the next step in the UiPath Automation Implementation Methodology is the Solution Design stage. In this stage, the Solution Architect, along with the Automation Developer and Project Manager, uses the insights from the Process Definition Document (PDD) to create a technical blueprint for the automation.

This stage is critical because it translates the "what" from the business process into the "how" in terms of automation design. It involves designing the To-Be process flow, defining technical components, data handling logic, exception paths, and other automation modules. The output of this stage is the Approved Solution Design Document (SDD), which acts as the guideline for developers during the next phase.

The Solution Design phase ensures the automation is scalable, maintainable, and aligned with UiPath best practices. A strong design phase reduces errors, shortens development time, and provides a clear roadmap for testing and deployment.

NEW QUESTION # 82

What document outlines the tests to be performed and logistics for end-user testing after development?

- A. Application Tracker
- B. **User Acceptance Testing (UAT) Plan**
- C. Solution Design Document (SDD)
- D. Project Readiness Checklist

Answer: B

Explanation:

The User Acceptance Testing (UAT) Plan is the document that details how end-user testing will occur once development is complete. It defines the test cases, success criteria, testing timelines, and responsible parties from both the Implementation and Client Teams. This document is essential for organizing the UAT phase, ensuring that all involved stakeholders are aware of what will be tested, how issues will be logged, and who is responsible for resolving them. It also outlines the criteria that must be met for the automation to be considered acceptable and ready for production.

The UAT Plan supports a structured and transparent testing process, minimizing the risk of miscommunication and ensuring that the delivered solution meets business expectations. It helps validate that the automation aligns with the agreed-upon requirements,

business rules, and user needs captured during the earlier stages of the project.

NEW QUESTION # 83

Which stage involves preparing the solution for live operation and monitoring its stability?

- A. Deployment and Hypercare
- B. Project Closure
- C. Business Case and Technical Validation
- D. Process Analysis

Answer: A

Explanation:

The Deployment and Hypercare stage is where the automation is prepared for live operation, and the stability of the deployed solution is closely monitored. This stage ensures that the automation, now in production, is performing as expected and that any early issues are resolved quickly.

Key activities in this stage include:

- * Deploying the automation to the production environment
- * Verifying production environment configurations
- * Monitoring bot behavior and performance
- * Providing quick support for unexpected issues
- * Training end users if needed

The Hypercare period is a temporary support window post-deployment in which the Automation Developer, Solution Architect, and Project Manager remain closely involved to resolve defects, gather feedback, and fine-tune the automation. This stage is critical to ensure user confidence and smooth adoption of the automation into regular operations.

NEW QUESTION # 84

Which stage involves analyzing the As-Is process and preparing documentation like the PDD?

- A. Project Closure
- B. Solution Design
- C. Process Analysis
- D. Development and Testing

Answer: C

Explanation:

The Process Analysis stage involves thoroughly analyzing the As-Is process and preparing the Process Definition Document (PDD). This stage is led by the Business Analyst and Solution Architect, often with input from process Subject Matter Experts (SMEs) from the Client Team.

Key activities include:

- * Shadowing process performers
- * Mapping step-by-step workflows
- * Identifying exceptions and business rules
- * Documenting input/output data
- * Noting system interactions

The PDD created in this stage becomes the foundation for the Solution Design and subsequent development phases. Accurate and complete documentation ensures that the automation solution will meet business needs and be technically sound.
