## Exam 312-97 Simulator & Latest ECCouncil Certification Training - ECCouncil EC-Council Certified DevSecOps Engineer (ECDE)

More and more people hope to enhance their professional competitiveness by obtaining ECCouncil certification. However, under the premise that the pass rate is strictly controlled, fierce competition makes it more and more difficult to pass the 312-97 examination. In order to guarantee the gold content of the 312-97 certification, the official must also do so. However, it is an indisputable fact that a large number of people fail to pass the 312-97 examination each year. Perhaps it was because of the work that there was not enough time to learn, or because the lack of the right method of learning led to a lot of time still failing to pass the exam. Whether you are the first or the second or even more taking 312-97 Exam, 312-97 study materials are accompanied by high quality and efficient services so that they can solve all your problems. Passing the exam once will no longer be a dream.

## ECCouncil EC-Council Certified DevSecOps Engineer (ECDE) Sample Questions (Q73-Q78):

### NEW QUESTION # 73

(Patricia Cornwell has been working as a DevSecOps engineer in an IT company that provides custom software solutions. She would like to use GitMiner to mine the secret credentials such as usernames and passwords, API credentials, and other sensitive data from GitHub. Therefore, to start the scanning, she cloned the repo to the local machine by using the `git clone http://github.com/UnkL4b/GitMiner` command; then, she moved to the current directory using `$ cd GitMiner` command. Which of the following commands should Patricia use to install the dependencies?)

- A. `pip3 install -d requirement.txt.`
- B. `pip3 install -q requirement.txt.`
- C. `pip3 install -m requirement.txt.`
- D. `pip3 install -r requirement.txt.`

Answer: D

Explanation:

GitMiner is a Python-based tool, and like most Python projects, it manages its dependencies through a requirements file named requirements.txt. The correct way to install all dependencies listed in this file is by using the pip3 install -r requirements.txt command. The -r flag instructs pip to read package names and versions from the specified file and install them accordingly. The other flags shown in the options do not correspond to dependency installation from a requirements file and would result in command errors or unexpected behavior. Installing dependencies correctly is a prerequisite for running GitMiner successfully. During the Code stage, tools like GitMiner help identify hard-coded secrets and sensitive information early, reducing the risk of credential leakage and preventing security incidents later in the DevSecOps pipeline.

#### NEW QUESTION # 74

(Peter McCarthy is working in TetraVerse Soft Solution Pvt. Ltd. as a DevSecOps engineer. His organization develops customized software products and web applications. To develop software products quickly and securely, his organization has been using AWS cloud-based services, including AWS DevOps services. Peter would like to use CloudMapper to examine the AWS cloud environment and perform auditing for security issues. Which of the following privileges should Peter possess in order to collect information about the AWS account?.)

- A. amaws:iam:aws:policy/SecurityAudit::SecurityCheck amaws:iam:aws:policy/job-role/ViewOnlyAccess:: EditOnlyAccess.
- **B. amaws:iam:aws:policy/SecurityAudit amaws:iam:aws:policy/job-function/ViewOnlyAccess.**
- C. amaws:iam:aws:policy/AWSLambdaFullAccess amaws:iam:aws:policy/job-role/ViewOnlyAccess.
- D. amaws:iam:aws:policy/SecurityCheck amaws:iam:aws:policy/job-function/ViewOnlyAccess:: EditOnlyAccess.

**Answer: B**

Explanation:

CloudMapper requires read-only access to AWS resources in order to collect metadata, visualize architectures, and perform security analysis without modifying infrastructure. The AWS-managed policy SecurityAudit provides permissions to view security-related configuration across services, while ViewOnlyAccess allows read-only access to AWS resources more broadly. Together, these policies enable CloudMapper to gather comprehensive information about the AWS environment without granting write privileges. The other options either reference invalid policy names, incorrect formatting, or excessive permissions such as AWSLambdaFullAccess, which are unnecessary and violate least-privilege principles.

Granting SecurityAudit and ViewOnlyAccess aligns with secure auditing practices during the Operate and Monitor stage.

#### NEW QUESTION # 75

(Evan Peters has been working as a DevSecOps engineer in an IT company located in Denver, Colorado. His organization has deployed various applications on Docker containers. Evan has been running SSH service inside the containers, and handling of SSH keys and access policies is a major security concern for him. What will be the solution for Evan security concern?)

- A. Run SSH on the docker build and utilize docker exec for interacting with the container.
- B. Run SSH on the registry and utilize docker exec for interacting with the container.
- **C. Run SSH on the host and utilize docker exec for interacting with the container.**
- D. Run SSH on the client and utilize docker exec for interacting with the container.

**Answer: C**

Explanation:

Running an SSH service inside Docker containers is considered a security anti-pattern because it increases the attack surface and complicates key and access management. Containers are designed to run a single primary process and be managed externally rather than accessed via SSH. The recommended solution is to run SSH on the host system and use docker exec to interact with containers when administrative access is required.

This approach eliminates the need to manage SSH keys inside containers, reduces exposure to brute-force attacks, and simplifies access control. The other options incorrectly suggest running SSH in inappropriate locations such as the registry, client, or build process, which do not address the core security concern. During the Operate and Monitor stage, minimizing unnecessary services within containers is critical to enforcing least privilege and maintaining a secure runtime environment.

### NEW QUESTION # 76

(William Edwards is working as a DevSecOps engineer at SVR Software Solution Pvt. Ltd. His organization develops software products and applications related to digital marketing. William integrated Prisma Cloud with Jenkins to detect threat-intelligence based threat detection. This integration will allow him to scan container images and serverless functions for security issues in the CI/CD pipeline. Which of the following is employed by Prisma Cloud to understand the normal network behavior of each customer's cloud environment to detect network anomalies and zero-day attacks effectively with minimal false positives?.)

- A. Advanced supervised data mining.
- B. Advanced unsupervised data mining.
- C. Advanced supervised machine learning.
- **D. Advanced unsupervised machine learning.**

**Answer: D**

Explanation:

Prisma Cloud leverages advanced unsupervised machine learning to establish baselines of normal behavior within a customer's cloud environment. By analyzing patterns in network traffic, resource interactions, and workload behavior without relying on labeled training data, it can detect anomalies and potential zero-day attacks with minimal false positives. Supervised approaches require predefined labels and known attack patterns, which limits effectiveness against new or unknown threats. Unsupervised data mining alone lacks the adaptive intelligence provided by machine learning models. Using unsupervised machine learning during the Build and Test stage enables continuous, intelligent security analysis across dynamic cloud-native workloads, supporting proactive threat detection in DevSecOps pipelines.

### NEW QUESTION # 77

(David Paymer has been working as a senior DevSecOps engineer in an IT company over the past 5 years. His organization is using Azure DevOps service to produce software products securely and quickly. David's team leader asked him to publish a NuGet package utilizing a command line. Imagine you are in David's place; which command would you use to publish NuGet package into the feed?.)

- A. `nuget.exe publish -Source "< YOUR_FEED_NAME >" -ApiKey < ANY_STRING > < PACKAGE_PATH >.`
- **B. `nuget.exe push -Source "< YOUR_FEED_NAME >" -ApiKey < ANY_STRING > < PACKAGE_PATH >.`**
- C. `nuget.exe push -Destination "< YOUR_FEED_NAME >" -ApiKey < ANY_STRING > < PACKAGE_PATH >.`
- D. `nuget.exe publish -Destination "< YOUR_FEED_NAME >" -ApiKey < ANY_STRING > < PACKAGE_PATH >.`

**Answer: B**

Explanation:

Publishing a NuGet package to a feed is done using the `nuget.exe push` command. The `-Source` parameter specifies the target feed name or URL, and the `-ApiKey` parameter is required even if the feed ignores its value. The `publish` verb is not used for NuGet package uploads, and `-Destination` is not a valid parameter for pushing packages. Therefore, `nuget.exe push -Source "<YOUR_FEED_NAME>" -ApiKey <ANY_STRING> <PACKAGE_PATH>` is the correct command. Using command-line publishing supports automation and consistency in DevSecOps workflows, enabling secure and repeatable artifact distribution as part of continuous delivery pipelines.
