To get better condition of life, we all need impeccable credentials of different exams to prove individual's capacity. However, weak SAA-C03 practice materials may descend and impair your ability and flunk you in the real exam unfortunately. And the worst condition is all that work you have paid may go down the drain for those SAA-C03 question torrent lack commitments and resolves to help custSAA-C03omers. Moreover, only need toSAA-C03 spend 20-30 is it enough for you to grasp whole content of SAA-C03 practice materials that you can pass the exam easily, this is simply unimaginable.

Amazon SAA-C03 exam consists of multiple-choice and multiple-response questions and is conducted online via the AWS Certification portal. SAA-C03 exam is 130 minutes long, and candidates are required to score at least 720 out of 1000 to pass. SAA-C03 Exam covers a wide range of topics, including AWS storage solutions, compute and networking services, security, and application integration. Candidates must have a solid understanding of these topics to be successful on the exam.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q89-Q94):

NEW QUESTION # 89

A company runs demonstration environments for its customers on Amazon EC2 instances. Each environment is isolated in its own VPC. The company's operations team needs to be notified when RDP or SSH access to an environment has been established.

- A. Configure an Amazon EventBridge rule to listen for events of type EC2 Instance State-change Notification. Configure an Amazon Simple Notification Service (Amazon SNS) topic as a target. Subscribe the operations team to the topic.
- B. Publish VPC flow logs to Amazon CloudWatch Logs. Create required metric filters. Create an Amazon CloudWatch metric alarm with a notification action for when the alarm is in the ALARM state.
- C. Configure Amazon CloudWatch Application Insights to create AWS Systems Manager OpsItems when RDP or SSH access is detected.
- D. Configure the EC2 instances with an IAM instance profile that has an IAM role with the AmazonSSMManagedInstanceCore policy attached.

Answer: B

NEW QUESTION # 90

A company has two VPCs named Management and Production. The Management VPC uses VPNs through a customer gateway to connect to a single device in the data center. The Production VPC uses a virtual private gateway AWS Direct Connect connections. The Management and Production VPCs both use a single VPC peering connection to allow communication between the What should a solutions architect do to mitigate any single point of failure in this architecture?

- A. Add a second VPC peering connection between the Management VPC and the Production VPC.
- B. Add a second set of VPNs to the Management VPC from a second customer gateway device.
- C. Add a set of VPNs between the Management and Production VPCs.
- D. Add a second virtual private gateway and attach it to the Management VPC.

Answer: B

Explanation:

This answer is correct because it provides redundancy for the VPN connection between the Management VPC and the data center. If one customer gateway device or one VPN tunnel becomes unavailable, the traffic can still flow over the second customer gateway device and the second VPN tunnel. This way, the single point of failure in the VPN connection is mitigated.

NEW QUESTION # 91

[Design Secure Architectures]

A solutions architect is designing an application that helps users fill out and submit registration forms. The solutions architect plans to use a two-tier architecture that includes a web application server tier and a worker tier.

The application needs to process submitted forms quickly. The application needs to process each form exactly once. The solution must ensure that no data is lost.

Which solution will meet these requirements?

- A. Use an Amazon Simple Queue Service (Amazon SQS) FIFO queue between the web application server tier and the worker tier to store and forward form data.
- B. Use an Amazon API Gateway HTTP API between the web application server tier and the worker tier to store and

forward form data.

- C. Use an AWS Step Functions workflow. Create a synchronous workflow between the web application server tier and the worker tier that stores and forwards form data.
- D. Use an Amazon Simple Queue Service (Amazon SQS) standard queue between the web application server tier and the worker tier to store and forward form data.

Answer: A

Explanation:

To process each form exactly once and ensure no data is lost, using an Amazon SQS FIFO (First-In-First-Out) queue is the most appropriate solution. SQS FIFO queues guarantee that messages are processed in the exact order they are sent and ensure that each message is processed exactly once. This ensures data consistency and reliability, both of which are crucial for processing user-submitted forms without data loss.

SQS acts as a buffer between the web application server and the worker tier, ensuring that submitted forms are stored reliably and forwarded to the worker tier for processing. This also decouples the application, improving its scalability and resilience.

Option B (API Gateway): API Gateway is better suited for API management rather than acting as a message queue for form processing.

Option C (SQS Standard Queue): While SQS Standard queues offer high throughput, they do not guarantee exactly-once processing or the strict ordering needed for this use case.

Option D (Step Functions): Step Functions are useful for orchestrating workflows but add unnecessary complexity for simple message queuing and form processing.

NEW QUESTION # 92

[Design High-Performing Architectures]

A company has an application that processes information from documents that users upload. When a user uploads a new document to an Amazon S3 bucket, an AWS Lambda function is invoked. The Lambda function processes information from the documents. The company discovers that the application did not process many recently uploaded documents. The company wants to ensure that the application processes each document with retries if there is an error during the first attempt to process the document.

Which solution will meet these requirements?

- A. Configure an Amazon Simple Queue Service (Amazon SQS) queue as an event source for the Lambda function.
Configure an S3 event notification on the S3 bucket to send new document upload events to the SQS queue.
- B. Configure a replication policy on the S3 bucket to stage the documents in another S3 bucket that an AWS Batch job processes on a daily schedule.
- C. Deploy an Application Load Balancer in front of the Lambda function that processes the documents.
- D. Create an Amazon API Gateway REST API that has a proxy integration to the Lambda function. Update the application to send requests to the REST API.

Answer: A

Explanation:

Using SQS as a buffer between S3 and the Lambda function ensures durability and allows for retries in case of processing failures. Messages in the queue can be retried by Lambda, and failed processing can be directed to a dead-letter queue for further inspection. This guarantees reliable and scalable message-driven processing.

NEW QUESTION # 93

A company wants to run a hybrid workload for data processing. The data needs to be accessed by on-premises applications for local data processing using an NFS protocol, and must also be accessible from the AWS Cloud for further analytics and batch processing.

Which solution will meet these requirements?

- A. Use an AWS Storage Gateway volume gateway in a cached volume configuration to back up all the local storage in the AWS Cloud, then perform analytics on this data in the cloud.
- B. Use an AWS Storage Gateway file gateway to provide file storage to AWS, then perform analytics on this data in the AWS Cloud.

- C. Use an AWS Storage Gateway tape gateway to copy the backup of the local data to AWS, then perform analytics on this data in the AWS Cloud.
- D. Use an AWS Storage Gateway volume gateway in a stored volume configuration to regularly take snapshots of the local data, then copy the data to AWS.

Answer: B

<divExplanation:

AWS Storage Gateway file gateway presents a file interface backed by Amazon S3 and supports NFS. This allows local applications to access data via NFS while also enabling cloud applications to use the data stored in S3 for analytics and processing, fulfilling both hybrid and cloud-native requirements.
