Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q41-Q46):

NEW QUESTION # 41

Which protocol should be analyzed when troubleshooting call quality between IP phones?

- A. SCCP
- B. SIP
- C. RTP

- D. 323: An older protocol suite for multimedia communication, encompassing both signaling and media, but less commonly used in modern IP telephony. Reference: Supporting Cisco Devices for Field Technicians (FLDTEC) - Troubleshooting Methodologie
- E. H.323

Answer: C

Explanation:

When addressing call quality issues between IP phones, the Real-time Transport Protocol (RTP) is the primary protocol to analyze. RTP is responsible for the actual transmission of voice data during a call, and its performance directly impacts call quality.

Key factors affecting RTP and, consequently, call quality include:

Packet Loss: Missing packets can lead to audio gaps.

Jitter: Variations in packet arrival times can cause choppy audio.

Latency: Delays in packet delivery can result in noticeable lag.

Analyzing RTP streams allows technicians to identify these issues and implement appropriate Quality of Service (QoS) measures to mitigate them.

In contrast:

SIP (Session Initiation Protocol): Handles call setup, modification, and teardown but not the media stream.

SCCP (Skinny Client Control Protocol): A Cisco proprietary protocol for signaling, not media transport.

NEW QUESTION # 42

Which Cisco UCS management platform is specifically designed for managing standalone Cisco UCS C-Series rack servers and E-Series servers?

- A. Cisco Intersight
- **B. Cisco Integrated Management Controller**
- C. Cisco UCS Manager
- D. Cisco UCS Central

Answer: B

Explanation:

The Cisco Integrated Management Controller (CIMC) is the embedded management solution designed specifically for standalone Cisco UCS C-Series rack servers and E-Series servers. It allows administrators to perform out-of-band management functions such as BIOS configuration, firmware updates, remote console access, and power control.

Cisco UCS Manager is used for managing UCS blade chassis environments.

Cisco UCS Central is intended for centralized management across multiple UCS domains.

Cisco Intersight is a cloud-based management platform that can extend CIMC functionality but is not the embedded, standalone option.

NEW QUESTION # 43

Why is it important to verify the update status after the initial upgrade process when upgrading firmware on a Cisco UCS C-Series server using the Host Upgrade Utility?

- **A. To confirm that all intended components were successfully updated**
- B. To activate the new licenses associated with the firmware
- C. To generate a report for compliance documentation
- D. To ensure compatibility with third-party applications

Answer: A

Explanation:

After upgrading the firmware on a Cisco UCS C-Series server using the Host Upgrade Utility (HUU), it is critical to verify the update status to ensure that all targeted components (such as BIOS, CIMC, and RAID controller firmware) have been successfully updated.

Firmware upgrades often involve multiple subsystems, and partial or failed updates can result in inconsistencies or even device instability. Verifying the update status allows the technician to identify any missed components and perform corrective actions if necessary.

Options like generating compliance reports, third-party application checks, or license activations are not the primary reasons for this

verification step in the HUU process.

NEW QUESTION # 44

Drag and drop the actions that must be taken after installing an E-Series server from the left into order on the right.

Answer:

NEW QUESTION # 45

What is the primary advantage of the Cisco Intersight cloud-based approach compared to traditional on-premises management tools?

- A. It requires less local storage
- B. It provides faster hardware upgrades
- C. It offers better integration with non-Cisco products
- **D. It allows management from anywhere without on-premises software**

Answer: D

Explanation:

The main advantage of Cisco Intersight is its cloud-based architecture, which allows IT administrators to manage infrastructure from any location without needing to install or maintain traditional on-premises management tools.

This provides:

- * Centralized visibility and control over UCS servers and HyperFlex infrastructure
- * Remote firmware upgrades and configuration
- * Policy-driven automation

Unlike on-premises tools, Intersight eliminates the overhead of maintaining dedicated infrastructure for management.
