EMC Dell PowerFlex Operate Exam Sample Questions (Q36-Q41):

NEW QUESTION # 36

Enabling Maintenance Mode on a node allows it to be removed from the cluster without impacting data availability. True. False.

- A. True**
- B. False

Answer: A

Explanation:

- * True: The specific purpose of Protected Maintenance Mode (PMM) is to ensure data availability.
- * How it works: When you enable PMM on a node, the system checks the data chunks residing on that node. Before the node is allowed to effectively "leave" the cluster (stop serving I/O), PowerFlex copies (mirrors) that data to other nodes in the cluster. This ensures that even when the node is physically removed or rebooted, the cluster retains the required number of data copies (redundancy), ensuring no data is unavailable (DU) or lost (DL).

NEW QUESTION # 37

How can storage pools in PowerFlex be expanded?

- A. Add additional disks to the existing pool**
- B. Create new protection domains
- C. Configure replication between clusters
- D. Increase the node count in the fault set

Answer: A

Explanation:

PowerFlex Storage Pools are elastic containers for physical drive capacity.

- * Add additional disks to the existing pool (Option A): You can expand a Storage Pool by physically inserting new drives into existing nodes and adding them to the pool, or by adding completely new nodes (populated with drives) to the cluster.
- * The Process: When new devices are added to a Storage Pool, the PowerFlex MDM automatically initiates a Rebalance operation. It moves existing data chunks from the full drives to the new empty drives until the usage percentage is equalized across all drives in the pool. This process is transparent to the host and increases both the capacity and the I/O performance of the pool.

NEW QUESTION # 38

What happens to active workloads during a PowerFlex upgrade?

- A. They are migrated to another cluster
- B. They are backed up and restored post-upgrade
- C. They are suspended until the upgrade is complete
- D. They continue running without disruption

Answer: D

Explanation:

PowerFlex is architected specifically for Non-Disruptive Upgrades (NDU).

* Continuous Operation (Option C): Active workloads (databases, VMs, containers) continue to run and process I/O throughout the entire upgrade process.

* How it works: When a node (SDS) needs to be upgraded, it is placed into Maintenance Mode. The system ensures that the data on that node is mirrored elsewhere or accessible from the secondary copy.

The SDC (client driver) on the application hosts automatically redirects I/O to the remaining healthy nodes. Once the node is upgraded and rebooted, it rejoins the cluster, and the SDC resumes sending I/O to it. This transparency ensures that applications experience zero downtime.

NEW QUESTION # 39

Which actions can administrators perform to enhance alerting capabilities in PowerFlex? (Choose two).

- A. Assign alert thresholds for critical events
- B. Configure SNMP trap destinations
- C. Enable encryption for alert traffic
- D. Schedule alert retention policies

Answer: A,B

Explanation:

* Configure SNMP trap destinations (Option A): This is the standard method for "enhancing" alerting beyond the local dashboard. By directing SNMP traps to an enterprise monitoring system (like SolarWinds, Nagios, or OpenManage), administrators ensure alerts are centralized and ticketed automatically.

* Assign alert thresholds for critical events (Option C): PowerFlex allows administrators to customize specific thresholds (e.g., "Alert if Storage Pool usage > 85%" or "Alert if Latency > 10ms").

Configuring these thresholds ensures that the alerting system is proactive and tailored to the specific workload needs, rather than relying solely on default "System Down" alerts.

NEW QUESTION # 40

What is the minimum bandwidth requirement for replicating volumes between PowerFlex clusters?

- A. 1 Gbps
- B. 10 Mbps
- C. 100 Mbps
- D. 10 Gbps

Answer: C

Explanation:

* 100 Mbps: While PowerFlex replication is highly efficient and only sends unique data chunks (deltas), the supported minimum reliable bandwidth for a WAN link between clusters is typically 100 Mbps.

* Reasoning: Below this speed, even moderate change rates in a production database would likely cause the replication journal to fill up faster than data can be drained to the remote site. This would lead to a "Buffer Full" state, causing the replication to pause or the system to lose its Recovery Point Objective (RPO) compliance.
