Palo Alto Networks XSOAR Engineer Sample Questions (Q57-Q62):

NEW QUESTION # 57
Multiple company assets were reported by vulnerability scanners as being vulnerable to CVE-2017-11882.
This vulnerability affects applications installed on workstations. The SOC team needs to take action and apply the new vulnerability patch that was just released. The team must first create a cause for each of the identified assets in ServiceNow IT Service Management (ITSM), in order to notify the IT department. Next, the team creates a task in the main playbook, which extracts the list of assets from the scanner report.
After the list of assets are created, what are the two solutions that the SOC team could take so that a case could be created and a patch installed? (Choose two.)

- A. Create a sub-playbook with a single input containing the computer names that will loop until the last item from the asset list (Condition: AreValuesEqual - Exit on yes - left:1, right 1) and perform the following tasks:-Active Directory User Enrichment based on the computerName-Create the ServiceNow Record by adding the enrichment information-Mark the ticket severity as Urgent
- B. Set a key for storing the iteration number and create a sub-playbook with a single input containing the computer names that will loop until the last item from the asset list (Exit condition: iterator equal to count of the number of item in the list) and perform the following tasks:-Increase the iterator value by one each time-Active Directory User Enrichment based on the computerName-Create the ServiceNow Record by adding the enrichment information-Mark the ticket severity as Urgent
- C. Create a sub-playbook with a single input containing the computer names that will loop 'For Each Input' and perform the following tasks:-Active Directory User Enrichment based on the computerName- Create the ServiceNow Record by adding the enrichment information-Mark the ticket severity as Urgent
- D. Set a key for storing the iteration number and create a sub-playbook with a single input containing the computer names that will loop until the last item from the asset list (Exit condition: iterator contains the count of the number of items in the list) and perform the following tasks:-Active Directory User Enrichment based on the computerName-Create the ServiceNow Record by adding the enrichment information-Mark the ticket severity as Urgent

Answer: B,C

NEW QUESTION # 58
A breakpoint is added to a saved playbook to ensure that it pauses before running the task "ad-delete-user." However, it is later discovered that an Active Directory account was deleted by this playbook, and the playbook did not pause at the breakpoint.
What is the cause of this issue?.

- A. The task was not configured to override input.
- B. The playbook does not stop at the breakpoint when run from an incident.
- C. The playbook was not set to "quiet mode.".
- D. The task was not set to "skip.".

Answer: B

Explanation:
The XSOAR Playbook Debugger documentation states that breakpoints only apply when the playbook is run in Debug mode, not when an incident triggers the playbook normally.
Running from an incident executes the playbook without debugger controls, so breakpoints are ignored- leading to the deletion task running normally.

NEW QUESTION # 59
Which Marketplace content pack will allow sharing of threat intelligence in STIX format?.

- A. Generic Export Indicators Service.
- B. MISP Server.
- C. External dynamic list.
- D. TAXII Server.

Answer: D

Explanation:
STIX/TAXII are industry-standard protocols for structured threat intelligence exchange. According to the Threat Intelligence section of the XSOAR documentation, TAXII servers and clients provide automated bidirectional sharing using STIX objects, supporting both ingestion and distribution of indicators, observables, relationships, and threat objects.
The TAXII Server content pack specifically enables an organization to expose its threat intelligence via a TAXII 2.0/2.1 compliant endpoint, where the transmitted data is formatted as STIX, making it the correct choice for sharing structured intelligence externally.
The Generic Export Indicators Service pack supports indicator export, but not in STIX format-it exports simple CSV, JSON, or list-based formats. MISP Server supports STIX ingestion and export but is considered a MISP-specific implementation and not the generic STIX distribution mechanism expected in the question.
External dynamic lists are not related to STIX or TAXII at all.
Thus, the correct answer is D, as only the TAXII Server pack is designed explicitly for STIX-formatted intelligence sharing.

NEW QUESTION # 60
An engineer creates a script to display data in markdown format for a layout. When configuring the layout, the new script is not listed.
Which missed configuration step will cause this behavior?.

- A. Ensuring the script has the necessary permissions.
- B. Using a markdown output type.
- C. Tagging the script with Dynamic Section.
- D. Adding the snippet as an integration command.

Answer: C

Explanation:
The XSOAR Layouts documentation states that scripts can appear inside incident layouts only when they are designated as Dynamic Section scripts. Dynamic Sections are special script types that run automatically within layouts to display enrichment data, contextual summaries, or markdown-rendered information.
When creating such a script, the developer must mark it with the "dynamic-section" tag; otherwise, XSOAR does not expose it as an option during layout configuration. Without this mandatory tag, the script is treated as an ordinary automation and therefore cannot be placed into layout components.
Permissions (option B) affect script execution but do not prevent it from appearing in the layout editor.
Integration commands (option C) are unrelated-dynamic sections do not use integration command definitions. Markdown output type (option D) determines formatting only and does not affect whether the script is selectable within the layout editor.
Thus, the missing configuration step is failing to tag the script as a Dynamic Section, making option A the correct answer according to the official XSOAR documentation.

NEW QUESTION # 61
Which content type cannot be managed using remote repositories?

- A. Exclusion List
- B. Lists
- C. Pre-processing rules
- D. Jobs

Answer: B
