Users are buying something online (such as H12-521_V1.0 learning materials), always want vendors to provide a fast and convenient sourcing channel to better ensure the user's use. Because without a quick purchase process, users of our H12-521_V1.0 learning materials will not be able to quickly start their own review program. So, our company employs many experts to design a fast sourcing channel for our H12-521_V1.0 Learning Materials. All users can implement fast purchase and use our learning materials.

Huawei H12-521_V1.0-ENU certification exam is a comprehensive exam that covers a wide range of topics related to intelligent vision technology. H12-521_V1.0 exam covers topics such as the principles of intelligent vision technology, the applications of intelligent vision technology, and the implementation of intelligent vision technology. H12-521_V1.0 Exam also covers topics such as the development of intelligent vision solutions, the deployment of intelligent vision solutions, and the management of intelligent vision solutions.

Exam H12-521_V1.0 Duration - H12-521_V1.0 Latest Exam Vce

It is apparent that a majority of people who are preparing for the H12-521_V1.0 exam would unavoidably feel nervous as the exam approaching. If you are still worried about the coming exam, since you have clicked into this website, you can just take it easy now, I can assure you that our company will present the antidote for you--our H12-521_V1.0 Learning Materials. And you will be grateful to choose our H12-521_V1.0 study questions for its high-effective to bring you to success.

Huawei H12-521_V1.0 (HCIP-Intelligent Vision V1.0) Exam is a certification exam that validates the skills and knowledge of professionals who specialize in intelligent vision technologies. H12-521_V1.0 exam is designed to test the ability of candidates to deploy, configure, and troubleshoot intelligent vision solutions that are based on Huawei technologies. The H12-521_V1.0 exam is an intermediate-level certification that is ideal for individuals who are looking to advance their careers in the field of intelligent vision.

Huawei H12-521_V1.0-ENU exam is intended for professionals who are involved in the development or implementation of intelligent vision solutions. This includes system engineers, network administrators, project managers, and technical managers. H12-521_V1.0 Exam is also suitable for those who are seeking to enhance their skills and knowledge in the field of intelligent vision, and who wish to pursue a career in this area. Candidates who pass the exam will be recognized as certified professionals by Huawei, and will have demonstrated their ability to design and deploy intelligent vision solutions that meet the requirements of the industry.

Huawei HCIP-Intelligent Vision V1.0 Sample Questions (Q29-Q34):

NEW QUESTION # 29

Which of the following features can provide perfect exposure for an object in backlight scenarios?

- A. White balance
- B. High resolution
- C. Highlight compensation HLC
- **D. Backlight compensation BLC**

Answer: D

Explanation:

The correct answer is A because Backlight Compensation (BLC) is the feature specifically intended to improve foreground object exposure when strong light is coming from behind the subject. In a backlight scene, the background is much brighter than the target, so the camera's default exposure logic may darken the object and make it difficult to identify. BLC corrects this by increasing exposure priority on the foreground region so the object can be seen more clearly.

This aligns with the exposure-focused design philosophy in the material, where Huawei emphasizes advanced exposure optimization. The document notes that "T-Shot, Huawei's patented exposure technology, enables optimal imaging of targets and vehicles at the same time" and explains that traditional exposure methods cannot correctly expose different objects within the same image under challenging conditions. In ordinary camera feature terminology, the standard function used for a backlit foreground target is BLC. By contrast, white balance adjusts color temperature, HLC suppresses excessively bright highlights such as headlights, and high resolution only increases detail, not exposure correction. Therefore, the correct feature for backlight object exposure is BLC.

NEW QUESTION # 30

Which of the following is not a prerequisite for high-density target capture?

- A. Excellent target detection algorithm
- B. Chips with high computing power
- **C. High-frequency exposure**
- D. Large memory

Answer: C

Explanation:

High-density target capture is a specialized capability designed for scenarios with high pedestrian traffic, such as urban squares or station exits, where crowd density can exceed 100 person-times in a single frame. This feature ensures accurate trajectory generation and optimal snapshots without missed or false captures in challenging environments. The technical architecture of this feature is built upon three fundamental pillars, as the system requires that high-density target capture enabled by: object detection algorithm and target trajectory generation algorithm + chip computing power + large-capacity memory.

Hardware requirements are particularly stringent, necessitating a professional AI chip, such as a 4 TOPS NPU, to manage the processing load of tracking up to 200 targets per frame. Large-capacity memory, typically 4 GB of DDR, is also vital to ensure an ultra-low snapshot repetition rate of less than 8%. While high-frequency exposure—specifically T-Shot double-exposure technology—is an advanced imaging technique used to capture clear snapshots of vehicles and targets simultaneously at night, it is a distinct imaging enhancement rather than a prerequisite for the high-density capture logic itself. High-frequency exposure focuses on resolving illumination and motion blur, whereas high-density capture focuses on the computational capacity to detect and track a massive volume of objects.

NEW QUESTION # 31

Which of the following best describes the primary-secondary camera observation function also called 1 + N?

- A. Multiple intelligent cameras connect to one PTZ camera for panoramic tracking.
- **B. One intelligent camera connects to multiple generic cameras and performs intelligent analysis on their streams.**
- C. One intelligent camera can only analyze its own local video stream.
- D. One generic camera connects to multiple intelligent cameras for storage expansion.

Answer: B

Explanation:

The correct answer is B because the 1 + N function is designed to extend intelligent analysis capability to existing non-intelligent cameras without replacing them. This is one of Huawei's practical upgrade approaches for legacy surveillance systems. The material

states that "With the proprietary 1 + N technology, a single intelligent camera can connect to N generic cameras on a live network, request streams from these cameras, and perform intelligent analysis on the streams" This directly matches option B . From a solution-design standpoint, this function is highly valuable in reconstruction projects where the existing camera network is still usable but lacks intelligent features such as target capture or vehicle recognition. Instead of replacing all cameras, one intelligent camera can act as the analysis point for several generic cameras, reducing upgrade cost and deployment complexity. Option A is wrong because the function is not for storage expansion. Option C incorrectly changes the relationship into intelligent-camera-to-PTZ cooperation. Option D is also wrong because the whole purpose of 1 + N is to analyze additional external streams, not just the local one. Therefore, B is the correct answer.

NEW QUESTION # 32

Which of the following is not a prerequisite for the intelligent vision platform to perform target capture statistics?

- A. A target fortification mission has been created for the camera on the platform
- B. Target recognition intelligent analysis task has been created for the camera on the platform
- C. Have subscribed to the face metadata generated by the smart camera on the platform
- D. The target recognition algorithm plug-in has been installed on the platform

Answer: A

NEW QUESTION # 33

For Huawei HoloSens IVS1800 multi-machine deployment network, what is the largest access scale of an iClent client camera?

- A. 128 way
- B. 64 way
- C. 256 way
- D. 32 way

Answer: C

NEW QUESTION # 34
