Salesforce Certified MuleSoft Associate Sample Questions (Q23-Q28):

NEW QUESTION # 23

During a planning session with the executive leadership, the development team director presents plans for a new API to expose the data in the company's order database. An earlier effort to build an API on top of this data failed, so the director is recommending a design-first approach.

Which characteristics of a design-first approach will help make this API successful?

- A. Developing a specification so consumers can test before the implementation is built**
- B. Adding global policies to the API so all developers automatically secure the implementation before coding anything
- C. Publishing the fully implemented API to Exchange so all developers can reuse the API
- D. Building MUnit tests so administrators can confirm code coverage percentage during deployment

Answer: A

Explanation:

A design-first approach emphasizes creating the API specification before implementation, ensuring better alignment with consumer needs and reducing the risk of project failure. Here's a detailed explanation:

API Specification:

Definition: An API specification is a detailed, formal description of the API's endpoints, request/response formats, and protocols.

Consumer Testing: Allows API consumers (developers) to understand, test, and provide feedback on the API design before actual development begins.

Advantages:

Early Feedback: Consumers can test the API design using mock services or tools like API Designer and provide feedback, ensuring the API meets their requirements.

Reduced Rework: Identifies potential issues and design flaws early, reducing costly changes during the implementation phase.

Documentation: Provides comprehensive documentation that aids in the development and future maintenance of the API.

Design-First Approach: Design-First API Development

API Mocking: API Designer Mocking Service

NEW QUESTION # 24

As part of a growth strategy a supplier signs a trading agreement with a large customer. The customer sends purchase orders to the supplier according to the ANSI X12 EDI standard and the supplier creates the orders in its ERP system using the information in the EDI document. The agreement also requires that the supplier provide a new RESTful API to process requests from the customer for current product inventory levels from the supplier's ERP system.

Which two fundamental integration use cases does the supplier need to deliver to provide an end-to-end solution for this business scenario? (Choose two.)

- A. Data mashups
- B. Sharing data with external partners
- C. Synchronized data transfer
- D. User interface integration
- E. Streaming data ingestion

Answer: B,C

Explanation:

To deliver an end-to-end solution for the described business scenario, the supplier needs to address both EDI processing and providing real-time data through a RESTful API. Here's a detailed explanation:

Sharing Data with External Partners:

EDI Integration: The supplier needs to process ANSI X12 EDI purchase orders from the customer and convert them into a format suitable for the ERP system.

Partner Integration: Establishing secure and reliable data exchanges with the customer is crucial for seamless transactions.

Synchronized Data Transfer:

Real-Time API: Providing a RESTful API to allow the customer to query current product inventory levels from the supplier's ERP system.

Data Consistency: Ensuring that the data provided through the API is accurate and up-to-date, reflecting the current state of the ERP system.

MuleSoft Documentation: EDI Integration

REST API Design: Designing APIs

Data Synchronization: Real-Time Integration

NEW QUESTION # 25

According to MuleSoft which principle is common to both Service Oriented Architecture (SOA) and API-Jed connectivity approaches*?

- A. Service statefulness
- B. Service centralization
- C. Service interdependence

NEW QUESTION # 26

Which productivity advantage does Anypoint Platform have to both implement and manage an API?

- A. Automatic API proxy generation
- B. Automatic API governance
- C. Automatic API specification generation
- D. Automatic API semantic versioning

Answer: A

Explanation:

Anypoint Platform, MuleSoft's unified platform for API design and integration, offers several productivity advantages for both implementing and managing APIs. Among these features, automatic API proxy generation is particularly beneficial. Here's a step-by-step explanation:

API Implementation:

Design Center: In the Design Center, users can create API specifications using RAML or OAS. This environment provides tools to design and document APIs effectively.

Exchange: After defining the API, it can be published to Anypoint Exchange where it can be shared and discovered by others within the organization.

Automatic API Proxy Generation:

When an API is published to Exchange, Anypoint Platform allows for the automatic creation of an API proxy. An API proxy acts as a facade for your backend API, providing a layer of abstraction and security.

Advantages:

Security: Protects backend services by exposing only necessary endpoints and handling authentication, authorization, and rate limiting.

Traffic Management: Helps in managing traffic through throttling and caching.

Monitoring: Facilitates monitoring and logging to track API usage and performance.

This automation saves time and reduces the complexity of manual proxy setup, allowing developers to focus on core business logic.

API Management:

API Manager: Provides a dashboard to manage API policies, versions, and SLA tiers. Users can apply security policies, monitor traffic, and analyze API usage.

Monitoring: Integrated with Anypoint Monitoring, users get insights into API performance and health, enabling proactive management.
