Terraform-Associate-003 Reliable Learning Materials & Latest Terraform-Associate-003 Cram Materials

Individuals who work with HashiCorp affiliations contribute the greater part of their energy working in their work spaces straightforwardly following accomplishing HashiCorp Certified: Terraform Associate (003) (HCTA0-003) certification. They don't get a lot of opportunity to spend on different exercises and regarding the HashiCorp Terraform-Associate-003 Dumps, they need

assistance to scrutinize accessible.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q173-Q178):

NEW QUESTION # 173

A Terraform provider is NOT responsible for:

- A. Exposing resources and data sources based on an API
- B. Understanding API interactions with some service
- C. Managing actions to take based on resources differences
- **D. Provisioning infrastructure in multiple**

Answer: D

Explanation:

Explanation

This is not a responsibility of a Terraform provider, as it does not make sense grammatically or logically. A Terraform provider is responsible for exposing resources and data sources based on an API, managing actions to take based on resource differences, and understanding API interactions with some service.

NEW QUESTION # 174

When you use a backend that requires authentication, it is best practice to:

- **A. Use environment variables to configure authentication credentials outside of your Terraform configuration.**
- B. None of the above.
- C. Run all Terraform commands on a shared server or container.
- D. Configure the authentication credentials in your Terraform configuration files, and store them in version control.

Answer: A

Explanation:

Detailed Explanation:

* Rationale for Correct Answer (C): Credentials should not be hardcoded in Terraform files. Best practice is to configure them via environment variables or secret managers.

* Analysis of Incorrect Options:

* A: Shared servers introduce risk and drift.

* B: Storing secrets in config/version control is insecure.

* D: Incorrect since option C is valid.

* Key Concept: Separation of credentials from code is a Terraform security best practice.

Reference: Terraform Exam Objective - Navigate Terraform State and Backends.

NEW QUESTION # 175

You have provisioned some virtual machines (VMs) on Google Cloud Platform (GCP) using the gcloud command line tool.

However, you are standardizing with Terraform and want to manage these VMs using Terraform instead. What are the two things you must do to achieve this? Choose two correct answers.

- A. Provision new VMs using Terraform with the same VM names
- B. Run the terraform Import-gcp command
- **C. Write Terraform configuration for the existing VMs**
- **D. Use the terraform import command for the existing VMs**

Answer: C,D

Explanation:

To import existing resources into Terraform, you need to do two things1:

Write a resource configuration block for each resource, matching the type and name used in your state file.

Run terraform import for each resource, specifying its address and ID. There is no such command as terraform Import-gcp, and provisioning new VMs with the same names will not import them into Terraform.

NEW QUESTION # 176

terraform plan updates your state file.

- A. False
- B. True

Answer: A

Explanation:

The terraform plan command does not update the state file. Instead, it reads the current state and the configuration files to determine what changes would be made to bring the real-world infrastructure into the desired state defined in the configuration. The plan operation is a read-only operation and does not modify the state or the infrastructure. It is the terraform apply command that actually applies changes and updates the state file.

References = Terraform's official guidelines and documentation clarify the purpose of the terraform plan command, highlighting its role in preparing and showing an execution plan without making any changes to the actual state or infrastructure .

NEW QUESTION # 177

A provider configuration block is required in every Terraform configuration.

Example:

□

- A. False
- B. True

Answer: A

Explanation:

A provider configuration block is not required in every Terraform configuration. A provider configuration block can be omitted if its contents would otherwise be empty. Terraform assumes an empty default configuration for any provider that is not explicitly configured. However, some providers may require some configuration arguments (such as endpoint URLs or cloud regions) before they can be used. A provider's documentation should list which configuration arguments it expects. For providers distributed on the Terraform Registry, versioned documentation is available on each provider's page, via the "Documentation" link in the provider's header¹.

References = [Provider Configuration]¹

NEW QUESTION # 178

.....

To contribute the long-term of cooperation with our customers, we offer great discount for purchasing our Terraform-Associate-003 exam.pdf. Comparing to other dumps vendors, the price of our Terraform-Associate-003 questions and answers is reasonable for every candidate. You will grasp the overall knowledge points of Terraform-Associate-003 Actual Test with our pass guide and the accuracy of our Terraform-Associate-003 exam answers will enable you spend less time and effort.
