P.S. Free 2026 VMware 3V0-23.25 dumps are available on Google Drive shared by Dumpexams: <https://drive.google.com/open?id=1IWBnbsUIqdDacLOesCAErVHa4nKWpCxB>

Our professional experts have carefully compiled our 3V0-23.25 practice braindumps to be the best seller in the market. The information is provided in the form of our 3V0-23.25 exam questions and answers, following the style of the real exam paper pattern. So if you buy our 3V0-23.25 training guide, you will find that it is easy to pass the exam for it is exam-oriented. What is more, you will learn a lot of work skills according to the latest information.

"Dumpexams" created a demo version for customer satisfaction so candidates can evaluate the 3V0-23.25 exam questions before purchasing. Also, "Dumpexams" has made this VMware 3V0-23.25 practice exam material budget-friendly with many benefits that make it the best choice. Our team of experts who designed this 3V0-23.25 Exam Questions assures that whoever prepares with it adequately, there is no doubt of failure and they will pass the VMware CERTIFICATION EXAM on the first attempt. Purchase our "Dumpexams" study material now and get free updates for up to 1 year.

>> Authentic 3V0-23.25 Exam Hub <<

**Pass Guaranteed Quiz 2026 Authoritative VMware Authentic 3V0-23.25 Exam Hub**

Our website offers you the most comprehensive 3V0-23.25 study guide for the actual test and the best quality service for aftersales. Our customers can easily access and download the 3V0-23.25 dumps pdf on many electronic devices including computer, laptop and Mac. Online test engine enjoys great reputation among IT workers because it brings you to the atmosphere of 3V0-23.25 Real Exam and remarks your mistakes.

## VMware Advanced VMware Cloud Foundation 9.0 Storage Sample Questions (Q26-Q31):

### NEW QUESTION # 26

A Compliance Auditor is reviewing the encryption and data-efficiency settings of a large VCF 9.0 environment. The environment contains a legacy VI Workload Domain running vSAN OSA, configured with strict data security and capacity optimization.

...

[Storage Policy View]

vSAN Cluster: Legacy-OSA-01

Data-at-Rest Encryption: Enabled (KMS Validated)

Deduplication and Compression: Enabled (All-Flash)

...

End users are complaining that application response times are sluggish during daily data ingestion windows, and vCenter alarms show ESXi CPU utilization at >95%.

How do the advanced data services in the OSA architecture contribute directly to this CPU saturation and resulting DOM congestion? (Select all that apply.)

- A. The integration of Deduplication and Encryption is natively incompatible in OSA; the hypervisor must decrypt the data first, dedup it, and then re-encrypt it, causing a double-tax on the CPU.
- B. Disabling Deduplication and Compression on this specific cluster would immediately relieve the CPU bottleneck, allowing the data to stream to the NVMe drives as raw blocks.
- C. If the CPU is pegged at 100% processing the Dedup hashes, the storage subsystem slows down, triggering DOM client congestion and causing the VM latency the end users are experiencing.
- D. In OSA, data must be compressed, deduped, and encrypted synchronously in the data path. Ingesting new data requires the CPU to execute SHA-1 hashing against the massive in-memory hash tables to find duplicates, consuming extreme amounts of CPU cycles.
- E. Deduplication hash tables are offloaded to the physical Top-of-Rack switches in VCF, meaning the ESXi CPU is a false indicator of the storage bottleneck.

**Answer: A,B,C,D**

### NEW QUESTION # 27

An administrator has been tasked with adding supplemental storage to an existing VMware Cloud Foundation (VCF) Workload Domain. The supplemental storage will add capacity for backup data and ISO images without impacting the principal storage used for live production workloads.

What should the administrator recommend meeting the requirement?

- A. Replace all existing datastores with NVMe devices.
- B. Attach additional NFS volumes or iSCSI datastores.
- C. Increase the VMFS principal storage allocation.
- D. Migrate Management Domain storage to a new cluster.

**Answer: B**

### NEW QUESTION # 28

A Network Administrator is auditing capacity policies in a VCF 9.0 environment running vSAN Express Storage Architecture (ESA).

The administrator queries the SPBM configuration applied to the cluster's base operational objects.

...

[vSAN Cluster Config Output]

vSAN Default Storage Policy

Storage Pool: ESA-NVMe-Pool

Rule: OSR (Object Space Reservation) = Thin provisioning

...

Why is the "Object Space Reservation" policy fundamentally different in vSAN ESA compared to the legacy vSAN OSA, and what specific objects still require reservations? (Select all that apply.)

- A. In OSA, Thick Provisioning allocated the raw physical sectors on the SATA drive; in ESA, Thick Provisioning pre-allocates NVMe memory pages, guaranteeing zero network congestion.
- B. ESA strictly requires OSR=100% when standard Deduplication is enabled.
- C. In vSAN ESA, user data (VMDKs) is ALWAYS strictly Thin Provisioned; the OSR UI option to reserve capacity for VM payload data has been completely deprecated due to the new log-structured metadata mapping.
- D. OSR=100% can still be applied in ESA, but ONLY to the specific "VM Home Namespace" object to ensure swap files and config files have guaranteed allocation during HA events.
- E. The log-structured nature of ESA writes data in append-only sequential stripes; it is mathematically impossible to "reserve" a specific physical sector before it is actually written, rendering traditional OSR definitions obsolete for block data.

**Answer: C,D,E**

### NEW QUESTION # 29

An administrator is tasked with setting up immutable snapshots for recovery in case of a cyber-attack. Which two limitations apply when configuring immutable snapshots? (Choose two.)

- A. The protection group cannot be both replicated and immutable.
- B. The Virtual Machine cannot be part of multiple protection groups.
- C. Virtual machine hardware cannot be changed on VM having immutable snapshots.
- D. The protection group cannot have more than 7 snapshot schedules.
- E. Virtual Machine hardware must be at least version 10.

**Answer: A,C**

Explanation:

Immutable snapshots are intended to provide hardened recovery points for cyber-recovery scenarios.

In vSAN Data Protection, immutability is enabled at the protection group level. Once enabled, snapshots are read-only recovery points that cannot be modified or deleted, even by an attacker with administrative privileges. This immutability model imposes operational restrictions. A VM with immutable snapshots should not have its virtual hardware changed because hardware changes can alter the VM configuration state associated with protected recovery points. In addition, a protection group cannot be configured as both replicated and immutable, because replication and immutable local snapshot protection are separate protection behaviors with different lifecycle and retention handling.

The statement that a VM cannot be part of multiple protection groups is not the specific limitation tested here. The number of snapshot schedules is not limited to seven by this requirement. Virtual hardware version 10 is also not the controlling condition for immutable snapshot configuration in this context. Reference topics: vSAN Data Protection, Immutable Snapshots, Protection Groups, Cyber- Recovery Snapshot Restrictions.

### NEW QUESTION # 30

A VCF Architect is designing a site disaster recovery strategy for a retail client operating a vSAN Stretched Cluster.

The client's network team has imposed strict limitations on inter-site traffic, noting that the Inter-Site Link (ISL) occasionally drops packets under heavy load. The storage policy is configured with "Dual Site Mirroring" and "Secondary FTT=1 (RAID-1)".

The architect is concerned about how a network partition (ISL failure) interacts with this storage policy regarding object accessibility and capacity planning.

Which of the following statements accurately describe the interaction between the network partition mechanics and the storage policy constraints? (Select all that apply.)

- A. The 'Secondary FTT=1 (RAID-1)' rule ensures that workloads on the isolated Secondary site can remain active by consuming the local replica copy without needing the Witness.
- B. If a network partition isolates the Secondary site from both the Preferred site and the Witness, the Secondary site's replica components will transition to the 'Inaccessible' state.
- C. A flapping network partition on the ISL could trigger a "Witness bandwidth exhaustion" event if the cluster frequently splits and merges, causing metadata resync storms.
- D. The Dual Site Mirroring policy implicitly relies on the Unicast agents maintaining connectivity to the Witness appliance to establish a quorum (>50% of votes) during an ISL failure.

**Answer: B,C,D**

## NEW QUESTION # 31

.....

On a regular basis, we update the PDF version to improve the 3V0-23.25 Questions and accurately reflect any changes that have been made to the test content. We know that Advanced VMware Cloud Foundation 9.0 Storage (3V0-23.25) certification exam costs can be high, with registration fees often running between \$100 and \$1000. We provide a free demo version of our product to ensure you are completely satisfied with our VMware Certification Exams preparation material. The purpose of this free demo is to help you make a well-informed decision.
