100% Pass Quiz 2026 Python Institute Perfect PCEP-30-02: Exam PCEP - Certified Entry-Level Python Programmer Online

P.S. Free & New PCEP-30-02 dumps are available on Google Drive shared by RealExamFree: https://drive.google.com/open?id=1HOKjrwlBTjeB4U50ncEKhJlbkJwCK1tS

The certification is necessary to get a job in your desired Python Institute company. Success in the test gives you an edge over the others because you will have certified skills that will make a good impression on the interviewer. Most people preparing for the PCEP-30-02 Exam are confused about preparation. How will they get real and updated PCEP - Certified Entry-Level Python Programmer (PCEP-30-02) exam questions?

If you are willing to purchase valid Python Institute PCEP-30-02 reliable vce exam simulator, you should be eagle-eyed since there are so much information on the internet. Valid products are hard to tell, once you find them, you will fell as if you'd found a priceless treasure. Our PCEP-30-02 reliable vce exam simulator will be your priceless products. Our passing rate is 100% recent two years. We can assure you that No Pass Full Refund. Our materials are valid and the best absolutely.

PCEP-30-02 Learning Materials: PCEP - Certified Entry-Level Python Programmer & PCEP-30-02 Test Braindumps

If you want to buy our PCEP-30-02 training guide in a preferential price, that's completely possible. In order to give back to the society, our company will prepare a number of coupons on our PCEP-30-02 learning dumps. And the number of our free coupon is limited. So you should click our website frequently. What's more, our coupon has an expiry date. You must use it before the deadline day. What are you waiting for? Come to buy our PCEP-30-02 Practice Engine at a cheaper price!

Python Institute PCEP - Certified Entry-Level Python Programmer Sample Questions (Q13-Q18):

NEW QUESTION # 13
What is the expected output of the following code?

- A. pizzapastafolpetti
- B. 0
- C. The code is erroneous and cannot be run.
- D. ppt

Answer: D

Explanation:
The code snippet that you have sent is using the slicing operation to get parts of a string and concatenate them together. The code is

as follows:
pizza = "pizza" pasta = "pasta" folpetti = "folpetti" print(pizza[0] + pasta[0] + folpetti[0]) The code starts with assigning the strings "pizza", "pasta", and "folpetti" to the variables pizza, pasta, and folpetti respectively. Then, it uses the print function to display the result of concatenating the first characters of each string. The first character of a string can be accessed by using the index 0 inside square brackets. For example, pizza[0] returns "p". The concatenation operation is used to join two or more strings together by using the + operator. For example, "a" + "b" returns "ab". The code prints the result of pizza[0] + pasta[0] + folpetti[0], which is "p" + "p" + "f", which is "ppt".
The expected output of the code is ppt, because the code prints the first characters of each string. Therefore, the correct answer is B. ppt.

NEW QUESTION # 14
What is the expected result of the following code?

- A. 0
- B. 1
- C. The code is erroneous and cannot be run.
- D. 2

Answer: C

Explanation:
The code snippet that you have sent is trying to use the global keyword to access and modify a global variable inside a function. The code is as follows:
speed = 10 def velocity(): global speed speed = speed + 10 return speed print(velocity()) The code starts with creating a global variable called "speed" and assigning it the value 10. A global variable is a variable that is defined outside any function and can be accessed by any part of the code. Then, the code defines a function called "velocity" that takes no parameters and returns the value of "speed" after adding 10 to it. Inside the function, the code uses the global keyword to declare that it wants to use the global variable
"speed", not a local one. A local variable is a variable that is defined inside a function and can only be accessed by that function. The global keyword allows the function to modify the global variable, not just read it. Then, the code adds 10 to the value of "speed" and returns it. Finally, the code calls the function "velocity" and prints the result.
However, the code has a problem. The problem is that the code uses the global keyword inside the function, but not outside. The global keyword is only needed when you want to modify a global variable inside a function, not when you want to create or access it outside a function. If you use the global keyword outside a function, you will get a SyntaxError exception, which is an error that occurs when the code does not follow the rules of the Python language. The code does not handle the exception, and therefore it will terminate with an error message.
The expected result of the code is an unhandled exception, because the code uses the global keyword incorrectly. Therefore, the correct answer is A. The code is erroneous and cannot be run.
Reference: Python Global Keyword - W3SchoolsPython Exceptions: An Introduction - Real Python The code is erroneous because it is trying to call the "velocity" function without passing any parameter, which will raise a TypeError exception. The "velocity" function requires one parameter "x", which is used to calculate the return value of "speed" multiplied by "x". If no parameter is passed, the function will not know what value to use for "x".
The code is also erroneous because it is trying to use the "new_speed" variable before it is defined. The
"new_speed" variable is assigned the value of 20 after the first function call, but it is used as a parameter for the second function call, which will raise a NameError exception. The variable should be defined before it is used in any expression or function call.
Therefore, the code will not run and will not produce any output.
The correct way to write the code would be:
# Define the speed variable
speed = 10
# Define the velocity function
def velocity(x):
return speed * x
# Define the new_speed variable
new_speed = 20
# Call the velocity function with new_speed as a parameter
print(velocity(new_speed))
Copy
This code will print 200, which is the result of 10 multiplied by 20.

NEW QUESTION # 15
What is the expected output of the following code?

- A. False
- B. The code raises an unhandled exception.
- C. ('Fermi ', '2021', 'False')
- D. 0

Answer: C

Explanation:
Explanation
The code snippet that you have sent is defining and calling a function in Python. The code is as follows:
def runner(brand, model, year): return (brand, model, year)
print(runner("Fermi"))
The code starts with defining a function called "runner" with three parameters: "brand", "model", and "year".
The function returns a tuple with the values of the parameters. A tuple is a data type in Python that can store multiple values in an ordered and immutable way. A tuple is created by using parentheses and separating the values with commas. For example, (1, 2, 3) is a tuple with three values.
Then, the code calls the function "runner" with the value "Fermi" for the "brand" parameter and prints the result. However, the function expects three arguments, but only one is given. This will cause a TypeError exception, which is an error that occurs when a function or operation receives an argument that has the wrong type or number. The code does not handle the exception, and therefore it will terminate with an error message.
However, if the code had handled the exception, or if the function had used default values for the missing parameters, the expected output of the code would be ('Fermi ', '2021', 'False'). This is because the function returns a tuple with the values of the parameters, and the print function displays the tuple to the screen.
Therefore, the correct answer is D. ('Fermi ', '2021', 'False').

NEW QUESTION # 16
A set of rules which defines the ways in which words can be coupled in sentences is called:

- A. lexis
- B. dictionary
- C. syntax
- D. semantics

Answer: C

Explanation:
Syntax is the branch of linguistics that studies the structure and rules of sentences in natural languages. Lexis is the vocabulary of a language. Semantics is the study of meaning in language. A dictionary is a collection of words and their definitions, synonyms, pronunciations, etc.

NEW QUESTION # 17
Python Is an example of which programming language category?

- A. compiled
- B. machine
- C. interpreted

- D. assembly

Answer: C

Explanation:
Python is an interpreted programming language, which means that the source code is translated into executable code by an interpreter at runtime, rather than by a compiler beforehand. Interpreted languages are more flexible and portable than compiled languages, but they are also slower and less efficient. Assembly and machine languages are low-level languages that are directly executed by the hardware, while compiled languages are high-level languages that are translated into machine code by a compiler before execution.
