## Palo Alto Networks PCCP Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> <li>Endpoint Security: This domain is aimed at an Endpoint Security Analyst and covers identifying indicators of compromise (IOCs) and understanding the limits of signature-based anti-malware. It includes concepts like User and Entity Behavior Analytics (UEBA), endpoint detection and response (EDR), and extended detection and response (XDR). It also describes behavioral threat prevention and endpoint security technologies such as host-based firewalls, intrusion prevention systems, device control, application control, disk encryption, patch management, and features of Cortex XDR.</li> </ul>
Topic 2	<ul style="list-style-type: none"> <li>Network Security: This domain targets a Network Security Specialist and includes knowledge of Zero Trust Network Access (ZTNA) characteristics, functions of stateless and next-generation firewalls (NGFWs), and the purpose of microsegmentation. It also covers common network security technologies such as intrusion prevention systems (IPS), URL filtering, DNS security, VPNs, and SSL</li> <li>TLS decryption. Candidates must understand the limitations of signature-based protection, deployment options for NGFWs, cybersecurity concerns in operational technology (OT) and IoT, cloud-delivered security services, and AI-powered security functions like Precision AI.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>Cybersecurity: This section of the exam measures skills of a Cybersecurity Practitioner and covers fundamental concepts of cybersecurity, including the components of the authentication, authorization, and accounting (AAA) framework, attacker techniques as defined by the MITRE ATT&amp;CK framework, and key principles of Zero Trust such as continuous monitoring and least privilege access. It also addresses understanding advanced persistent threats (APT) and common security technologies like identity and access management (IAM), multi-factor authentication (MFA), mobile device and application management, and email security.</li> </ul>

Topic 4	<ul style="list-style-type: none"><li>• <b>Secure Access:</b> This part of the exam measures skills of a Secure Access Engineer and focuses on defining and differentiating Secure Access Service Edge (SASE) and Secure Service Edge (SSE). It covers challenges related to confidentiality, integrity, and availability of data and applications across data, private apps, SaaS, and AI tools. It examines security technologies including secure web gateways, enterprise browsers, remote browser isolation, data loss prevention (DLP), and cloud access security brokers (CASB). The section also describes Software-Defined Wide Area Network (SD-WAN) and Prisma SASE solutions such as Prisma Access, SD-WAN, AI Access, and enterprise DLP.</li></ul>

## PrepAwayPDF Commitment to Your Palo Alto Networks PCCP Exam Success

Our PCCP study materials are compiled specially for time-sensitive exam candidates if you are wondering. Eliminating all invaluable questions, we offer PCCP practice guide with real-environment questions and detailed questions with unreliable prices upon them and guarantee you can master them effectively. As you see on our website, our price of the PCCP Exam Question is really reasonable and favourable.

## Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q75-Q80):

### NEW QUESTION # 75

Routing Information Protocol (RIP), uses what metric to determine how network traffic should flow?

- A. Split Horizon
- **B. Hop Count**
- C. Shortest Path
- D. Path Vector

**Answer: B**

Explanation:

Routing Information Protocol (RIP) is an example of a distance-vector routing protocol that uses hop count as its routing metric. To prevent routing loops, in which packets effectively get stuck bouncing between various router nodes, RIP implements a hop limit of 15, which limits the size of networks that RIP can support. After a data packet crosses 15 router nodes (hops) between a source and a destination, the destination is considered unreachable.

### NEW QUESTION # 76

Which network analysis tool can be used to record packet captures?

- **A. Wireshark**
- B. Netman
- C. Smart IP Scanner
- D. Angry IP Scanner

**Answer: A**

Explanation:

Wireshark is a network analysis tool that can capture packets from various network interfaces and protocols. It can display the captured packets in a human-readable format, as well as filter, analyze, and export them. Wireshark is widely used for network troubleshooting, security testing, and education purposes<sup>12</sup>. ### NEW QUESTION # 77

What is a key method used to secure sensitive data in Software-as-a-Service (SaaS) applications?

- A. Leave data security in the hands of the cloud service provider.
- **B. Allow downloads to managed devices but block them from unmanaged devices.**
- C. Allow downloads to both managed and unmanaged devices.
- D. Allow users to choose their own applications to access data.

**Answer: B**

Explanation:

One of the best practices for securing sensitive data in SaaS applications is to control the access and usage of data based on the device type. Managed devices are those that are enrolled and monitored by the organization's IT department, and have security policies and controls applied to them. Unmanaged devices are those that are not under the organization's control, such as personal laptops or mobile phones. Allowing downloads to managed devices but blocking them from unmanaged devices prevents data leakage and unauthorized access to sensitive data. This can be achieved by using a cloud access security broker (CASB) solution, such as Prisma SaaS from Palo Alto Networks, which can enforce granular policies based on device posture, user identity, and data sensitivity [1]. References: 1: Securing SaaS applications on the cloud is a critical aspect of protecting sensitive data and maintaining the trust of customers. By implementing best practices, such as enhanced authentication, data encryption, Break Glass, and oversight, organizations can mitigate the security risks associated with SaaS applications [2]. #### **NEW QUESTION # 78**

Which three layers of the OSI model correspond to the Application Layer (L4) of the TCP/IP model?

- A. Physical, Data Link, Network
- B. Data Link, Session, Transport
- C. Session, Transport, Network
- **D. Application, Presentation, and Session**

**Answer: D**

Explanation:

Application (Layer 4 or L4): This layer loosely corresponds to Layers 5 through 7 of the OSI model.

Transport (Layer 3 or L3): This layer corresponds to Layer 4 of the OSI model.

Internet (Layer 2 or L2): This layer corresponds to Layer 3 of the OSI model.

Network Access (Layer 1 or L1): This layer corresponds to Layers 1 and 2 of the OSI model

#### **NEW QUESTION # 79**

Which term describes data packets that move in and out of the virtualized environment from the host network or a corresponding traditional data center?

- A. Intrazone traffic
- B. Interzone traffic
- **C. North-South traffic**
- D. East-West traffic

**Answer: C**

Explanation:

North-South traffic refers to the data packets that move between the virtualized environment and the external network, such as the internet or a traditional data center. This traffic typically involves requests from clients to access applications or services hosted on virtual machines (VMs) or containers, or responses from those VMs or containers to the clients. North-South traffic can also include management or monitoring traffic from external devices to the virtualized environment. References: Fundamentals of Cloud Security, East-West and North-South Traffic Security, What is the meaning / origin of the terms north-south and east-west traffic?
