In order to cater to different kinds of needs of customers, three versions for D-PVM-OE-01 learning materials are available. You can choose one you prefer according to your own needs. D-PVM-OE-01 PDF version is printable and you can study anywhere and anyplace. D-PVM-OE-01 Soft test engine supports MS operating system and have two modes for practice. In addition, D-PVM-OE-01 Soft test engine can simulate the real exam environment, and your confidence for the exam can be strengthened through this version. D-PVM-OE-01 Online test engine is convenient and easy to study, it supports all web browsers, and it has testing history and performance review, so that you can have a general review before next training.

## EMC D-PVM-OE-01 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Unisphere for PowerMax 10 Implementation and Administration: This section of the exam measures the skills of System Administrators and covers the implementation and management of Unisphere for PowerMax. Candidates must understand the installation process, post-installation tasks, and interface navigation to efficiently operate the platform. One key skill evaluated is setting up Unisphere for PowerMax.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>PowerMaxOS 10 Data Mobility: This section of the exam measures the skills of Data Migration Specialists and covers data mobility and migration features in PowerMaxOS 10. Candidates must understand the benefits of non-disruptive migration and be able to perform migrations using Unisphere for PowerMax. One key skill assessed is executing non-disruptive data migrations.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>PowerMax Family Monitoring and Workload Planning: This section of the exam measures the skills of Performance Analysts and focuses on monitoring storage environments and workload planning using Unisphere for PowerMax. Candidates must understand how to track performance metrics, detect issues, and optimize workloads to enhance storage efficiency. One key skill tested is monitoring storage health through Unisphere.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>PowerMax Family Business Continuity Administration: This section of the exam measures the skills of Disaster Recovery Engineers and focuses on replication technologies used for business continuity. Candidates must perform SnapVX and Clone operations using Unisphere for PowerMax and understand Symmetrix Remote Data Facility (SRDF) replication. They must also execute SRDF operations using Unisphere and SYMCLI.</li></ul>

Topic 5	<ul style="list-style-type: none"> <li>PowerMax Family Storage Provisioning: This section of the exam measures the skills of Storage Administrators and covers the architecture, configurations, and management of the PowerMax family. Candidates must understand system models, port and device management, and provisioning methods using Unisphere for PowerMax. They are expected to perform service level-based provisioning and allocate storage through auto-provisioning groups. One key skill assessed is configuring storage using Unisphere for PowerMax.</li> </ul>
Topic 6	<ul style="list-style-type: none"> <li>PowerMax Family Local and Remote Replication Concepts: This section of the exam measures the skills of Backup and Recovery Specialists and covers the features and functionalities of TimeFinder SnapVX. Candidates must differentiate between SnapVX snapshots and clones while understanding their role in data protection. One key skill assessed is comparing the use cases of snapshots and clones.</li> </ul>

### Experience The Real Environment With The Help Of EMC D-PVM-OE-01 Exam Questions

Our website offer you one-year free update D-PVM-OE-01 study guide from the date of you purchased. We will send you the latest version to your email immediately once we have any updating about the D-PVM-OE-01 braindumps. Our goal is ensure you get high passing score in the D-PVM-OE-01 Practice Exam with less effort and less time. The accuracy of our questions and answers will the guarantee of passing actual test.

### EMC Dell Technologies PowerMax Operate Sample Questions (Q53-Q58):

#### NEW QUESTION # 53

A storage administrator is using SE 10 to query a PowerMax 2000 using `symcfg list -dir` and wants to see the number of Cores that are assigned to the front-end emulations What does the storage administrator need to do?

- **A. Use the -mode v9x argument for backwards compatibility as some output has been deprecated**
- B. Look for CPU instead of Cores as these have been rebranded to allow differentiating between virtual and physical hardware.
- C. Specify the full 12-digit serial number with -sid so SE 10 understands the output relates to an older system model.
- D. Use `syracfg -version -dir` as in SE 10 support for outputs specific to older systems moved to a different command.

**Answer: A**

Explanation:

Step by Step Comprehensive Detailed Explanation:

Solutions Enabler (SE) 10 introduces some changes to the output format of certain commands for better clarity and consistency.

When querying a PowerMax 2000 (which is based on older VMAX architecture) using `symcfg list -dir`, you might encounter differences in the output compared to previous SE versions.

To ensure backward compatibility and see the output in the familiar format, you need to use the `-mode v9x` argument. This tells SE 10 to display the output in the style of SE 9.x, which is compatible with the PowerMax 2000.

Why other options are incorrect:

\* B. Look for CPU instead of Cores as these have been rebranded...:While there might be terminology changes, this is not the primary reason for the output difference.

\* C. Specify the full 12-digit serial number with `-sid` so SE 10 understands...:The serial number is not directly related to the output format.

\* D. Use `syracfg -version -dir` as in SE 10 support for outputs...:The `syracfg` command is not the correct command for this purpose.

#### NEW QUESTION # 54

Which Threshold levels must be set when creating customized threshold alerts in Unisphere for PowerMax?

- A. Stable, Critical, and Fatal
- B. Warning, Marginal, and Critical
- C. Stable, Marginal, and Critical
- **D. Warning, Critical, and Fatal**

**Answer: D**

#### NEW QUESTION # 55

A systems administrator wants to move an application to VMAX3 storage. The application being migrated has no performance information available, including response time and average I/O size.

Based on Dell Technologies' recommendations, which service level should be assigned?

- A. Bronze
- B. Gold
- C. Diamond
- **D. Optimized**

**Answer: D**

#### NEW QUESTION # 56

What are the Compliance levels for Storage Groups in Unisphere for PowerMax?

- A. Fatal Critical Warning, and No Status
- B. Critical, Marginal, Warning, and No Status
- C. Fatal, Critical, Stable, and No Status
- **D. Critical, Marginal, Stable, and No Status**

**Answer: D**

#### NEW QUESTION # 57

An administrator is using the Workload Planner feature in Unisphere for PowerMax. How does the Planner calculate if the Storage Group workload is stable?

- A. Both calculated values are within a 10-15% threshold of the SL-defined response time
- B. One of the calculated values remains within the SL-defined response time
- **C. Both calculated values are within the SL-defined response time.**
- D. One of the calculated values is within 10-20% of the SL-defined response time

**Answer: C**

Explanation:

Step by Step Comprehensive Detailed Explanation:

The Workload Planner in Unisphere for PowerMax helps you analyze and predict the performance impact of adding new workloads to your storage array. It uses sophisticated algorithms to calculate how the addition of a new workload will affect the existing workloads and whether it will violate any service level objectives (SLOs).

To determine if a Storage Group workload is stable, the Planner considers two key calculated values:

\* Read Response Time: The predicted read response time of the Storage Group after the new workload is added.

\* Write Response Time: The predicted write response time of the Storage Group after the new workload is added.

The Planner compares these calculated values against the service level (SL) defined for the Storage Group. If both the calculated read and write response times fall within the defined SL response time, the Planner considers the workload to be stable. This means that the new workload can be added without negatively impacting the performance of the existing workloads or violating the SLOs.

Why other options are incorrect:

\* A. One of the calculated values is within 10-20% of the SL-defined response time: Both read and write response times must be within the defined SL, not just one.

\* B. Both calculated values are within a 10-15% threshold of the SL-defined response time: The threshold is not fixed at 10-15%.

\* C. One of the calculated values remains within the SL-defined response time: Again, both read and write response times need to be within the defined SL.

\* Dell Unisphere for PowerMax 10.0.0 Online Help: The online help for Unisphere provides detailed information about the Workload Planner feature, including how it calculates and analyzes workload stability. You can access this help within Unisphere itself or on the Dell Support website.
