UiPath Certified Professional Agentic Automation Associate (UiAAA) Sample Questions (Q21-Q26):

NEW QUESTION # 21

What is a characteristic of using Business Process Model and Notation by process excellence practitioners?

- A. It is only used for modeling static workflows without support for dynamic or unpredictable process changes.
- **B. It acts as an enabler for standards-based, model-driven collaboration between business groups and IT implementers.**
- C. It lacks constructs such as error and exception handling support, limiting its use for controlled automation design.
- D. It solely provides tools for designing aesthetic workflows, with no focus on controlled automation or dynamic process management.

Answer: B

Explanation:

The correct answer is C- Business Process Model and Notation (BPMN) is a standards-based modeling language used by process excellence practitioners to visually define, communicate, and govern business workflows.

In UiPath's Maestro orchestration platform, BPMN acts as a collaborative bridge between:

- * Business stakeholders (who define processes and goals)
- * Technical implementers (who build automations and agent logic)

BPMN includes rich constructs such as:

- * Gateways for conditional logic
- * Events for escalations and errors
- * Tasks, subprocesses, and human interventions

This makes it ideal for dynamic, agentic workflows- not just static process mapping.

A and B are false - BPMN is built for adaptive, automated, and collaborative orchestration.

D is wrong - BPMN supports error handling, retries, and fallback flows, all critical in agentic automation.

NEW QUESTION # 22

Which statement best describes UiPath Maestro's capability for deploying AI agents within a BPMN-modeled process?

- A. Maestro embeds external agents as inline code scripts inside the BPMN file and relies on each provider's runtime instead of Maestro's orchestration engine.
- **B. Maestro deploys agents from UiPath and external providers-such as LangChain, CrewAI, or Agentforce-through one consistent framework that includes human-in-the-loop orchestration.**
- C. Maestro deploys only UiPath-built agents in robot-driven processes; any third-party agents must be integrated through external platforms without human checkpoints.
- D. Maestro is a workflow engine similar to UiPath Studio, but it only allows you to invoke Agentic and Integration tasks.

Answer: B

Explanation:

The correct answer is C- UiPath Maestro enables agentic orchestration by serving as a process modeling and execution layer for AI agents, RPA bots, human reviewers, and external systems. It supports BPMN-based modeling and integrates both UiPath-built agents and external agents, such as those from LangChain, CrewAI

, or Agentforce.

Maestro provides a consistent framework that allows:

- * Invoking LLM-powered agents as subprocesses or service calls
- * Managing escalations and human-in-the-loop workflows
- * Defining structured inputs, outputs, and triggers using visual tools

* Coordinating across hybrid environments, mixing RPA, agents, and APIs

This aligns with UiPath's Agentic Automation vision, where agents are not isolated but operate within enterprise-grade governance and control structures. Maestro enables scalable deployment of goal-driven, adaptive agents inside complex, orchestrated processes.

Option A is incorrect - Maestro doesn't embed code scripts or rely solely on external runtimes.

B is false - Maestro is broader than just Agentic and Integration tasks.

D is outdated - Maestro can orchestrate third-party agents with human review checkpoints via its own framework.

Maestro essentially acts as the central nervous system for agent coordination, making C the most accurate answer.

NEW QUESTION # 23

What is the primary role of guardrails in tools?

- A. Guardrails are used exclusively to automate all tool corrections without the possibility of triggering human intervention.
- **B. Guardrails control unexpected behaviors within tool calls deterministically, allowing developers to configure conditions for human intervention and escalations.**
- C. Guardrails only validate tool inputs during development and do not address unpredictable behaviors at runtime.
- D. Guardrails are designed to apply only after tool execution, without influencing pre-execution conditions.

Answer: B

Explanation:

B is correct - in UiPath's agent framework, guardrails play a critical role in controlling tool behavior and decision outcomes during agent execution. Specifically, guardrails enable developers to handle edge cases and define conditions under which:

* The agent should escalate to a human

* A tool should be skipped, modified, or retried

* Output should be checked against validation rules

Guardrails work deterministically, meaning they are rule-based conditions applied before, during, or after a tool runs - depending on the configuration. This allows for predictable and governed responses, such as:

"If tool output confidence is below 70%, escalate the task to Action Center." Option A is incorrect because guardrails can and often do trigger human intervention.

Option C is false - guardrails can influence pre-execution, such as preventing tool calls under certain input conditions.

Option D downplays runtime functionality - guardrails are especially powerful during execution to protect against invalid results, failed API calls, or LLM drift.

UiPath promotes the use of guardrails to ensure safe, accurate, and context-aware agent behavior, especially in regulated or sensitive environments.

NEW QUESTION # 24

What is the defining characteristic of few-shot prompting?

- **A. It uses several examples to help the model understand the task better.**
- B. It requires the model to generate a response with no examples or instructions.
- C. It relies on intermediate reasoning steps to guide the model's response.
- D. It links multiple prompts together in a sequential workflow.

Answer: A

Explanation:

B is correct - the defining feature of few-shot prompting is the inclusion of multiple input-output examples within the prompt to demonstrate the desired behavior or output structure to the LLM.

In UiPath's Agentic Prompting practices, few-shot examples help:

* Anchor the model to a consistent format

* Reduce ambiguity in task instructions

* Improve performance in tasks like classification, transformation, or content generation Example:

Input: "My password isn't working"

Output: "Category: Login Issue"

Input: "App won't open."

Output: "Category: Access Error"

This trains the model within the prompt - no fine-tuning required - making it a powerful design pattern in building intelligent agents.

Option A describes chain-of-thought prompting.

B refers to zero-shot prompting.

C refers to prompt chaining, used in advanced orchestration, not few-shot logic.

NEW QUESTION # 25

Which similarity search function is leveraged when Context Grounding is used by UiPath Products like Agents?

- A. Cosine similarity search
- B. Sigmoid similarity search
- C. Softmax similarity search
- D. ReLu similarity search

Answer: A
